DATA BOOK

MOTOR CONTROL & DRIVER IC SERIES

1992

The information contained herein is subject to change without notice.

The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others.

These TOSHIBA products are intended for usage in general electronic equipments (office equipment, communication equipment, measuring equipment, domestic electrification, etc.). Please make sure that you consult with us before you use these TOSHIBA products in equipments which require high quality and/or reliability, and in equipments which could have major impact to the welfare of human life (atomic energy control, airplane, spaceship, traffic signal, combustion control, all types of safety devices, etc.). TOSHIBA cannot accept liability to any damage which may occur in case these TOSHIBA products were used in the mentioned equipments without prior consultation with TOSHIBA.

Taking this opportunity, we express our gratitude for your purchase of Toshiba semiconductor products.

We are pleased to inform you that our publication "Toshiba Motor Control & Driver IC Series Data Book (1992)" has been completed.

Precision micro motors and actuators — and as their controls, semiconductors such as IC and LSI — are used in main and auxiliary drive mechanisms. It is no exaggeration to state that these drive mechanisms form the "hearts" of nearly all AV, OA, and FA systems that have been developed and mass-produced recently.

High-accuracy spindles and actuator head drives of laser-use electronic devices such as optical disk drives, compact disk players (CDP), video disk players (VDP) etc., spindles and head drives of high-density recording systems such as floppy disk drives (FDD) and hard disk drives (HDD) —and in particular, driving mechanisms of factory automations, robots, etc.— can be attributed to the collective results of updated control, high-accuracy machining and semiconductor techniques, forming part of "mechatronics," and all-inclusive title concerning interface technology of both mechanical and electronic-controlled systems.

Such driving mechanisms employ DC brush motors, brushless motors, stepping motors, voice coil motors, solenoids and so on in accordance with requirements for them. Toshiba's newly completed Data Book describes IC's for the controls and drives of the systems mentioned above.

The applied circuits and other items displayed in this publication are shown for your reference in practical use. Kindly note that Toshiba Corporation in no case shall be obligated to assume responsibility for the infringement of any third party's patent, or any other rights, resulting from using the circuits displayed in this Data Book. The products described in this document contain strategic products subject to COCOM regulations. They should not be exported without authorization from the appropriate governmental authorities.

How to Use This Data Book

IC's for controlling and driving motors can be classified under two categories—(1) in accordance with motors to be controlled or (2) with equipments to be used. The first category, for example, includes IC's for hall motor drivers, IC's for brush motors, and IC's for stepping motors. In the second category, IC's are listed in accordance with their applications such as IC's for VCR or IC's for HDD.

For the convenience of users, this Data Book contains two indexes—(1) classified according to motors and (2) classified by applications—to enable you to quickly and conveniently find the particular IC wanted. If you have already chosen a motor, the necessary IC can be found by consulting the “Motor Control/Drive Circuit Line Up.” If you have decided on an application, the necessary IC for the motor can be found in the Applications.

For the IC found from both indexes, consult the page in the “FUNCTION INDEX,, (Page 7), pages for their data sheets are shown in the Indexes and Sheets.

IMPORTANT NOTICE

Toshiba does not assume any responsibility for use of any circuitry described; no circuit patent licenses are implied, and Toshiba reserves the right, at any time without notice, to change said circuitry.

Contents

1. FUNCTION INDEX (General Information)	7
2. MOTOR CONTROL/DRIVE CIRCUIT LINE UP	
2-1 Solenoid/Actuator Driver IC's	15
2-2 Stepping Motor IC's	17
2-3 Hall Motor IC's	19
2-4 Bridge Driver IC's	21
2-5 Hybrid IC's and Multichip IC's	23
3. APPLICATIONS	
3-1 Applications List	27
3-2 PPC, Facsimile, Printer, and Electronic Typewriter	29
3-3 FDD, HDD, and Optical Disk	33
3-4 Fan Motor	35
3-5 VCR	37
3-6 CDP and Camera	39
4. DATA SHEETS	41~761
5. HANDLING PRECAUTIONS	
5-1 Common Items for Packages	765
5-2 Special Notes on Packages	767
5-3 Mounting of Flat Packages	772
6. PACKING INFORMATION	
6-1 Stick Specifications for Flat Packages	777
6-2 Taping Specifications for Flat Packages	778
6-3 Embossed Taping Specifications for Flat Packages	780
7. PACKAGE LIST	785

1. FUNCTION INDEX

(General Information)

1. FUNCTION INDEX (General Information)

Equipment	Model	Package	Max. rating	Functions	Page
PLL controller	TC9142AP	DIP 16-P-300A	—	8-bit D/A conversion-type F/V P/V converter incorporated, no adjustment required	605
	TC9192AP/AF	DIP 18-P-300A SOP20-P-300	—	Double PLL controller incorporating 8-bit D/A converter	620
	TC9193AP/AF	DIP 18-P-300A SOP20-P-300	7V 20mA	Same as TC9142AP, for motor control of floppy disk driver (FDD)	634
	TC9203AP/AF	DIP 16-P-300A SOP 16-P-300	—	Same as TC9142AP, changing 300/360 rpm possible (for FDD)	645
Phase comparator	TC5081AP	SIP 9-P-A	—	General-use phase comparator	663
F/V converter	TA7715P	DIP 16-P-300A	—	S/H type F/V converter	195
Hall motor controller	TA7712P/F	DIP 20-P-300A SSOP 24-P-300	8V 25mA	3-phase single-chip hall motor controller	169
	TA7713P	DIP 20-P-300A	8V 25mA	3-phase single-chip hall motor controller for video disk	181
	TA7759P	DIP 18-P-300A	18V 10mA	4-phase half-wave hall motor controller	230
	TA8412P/F	DIP 20-P-300A SSOP 24-P-300	18V 100mA	3-phase single-chip hall motor controller	310
	TA8413P	DIP 20-P-300A	18V 100mA	3-phase single-chip hall motor controller	315
	TA8443F	QFP 60-P-1414F	—	PLL-PWM type hall motor controller (constant angular velocity type), multichip IC of TC9203, TA76494 and TA7712	460
Hall motor driver	TA7245BP/BP (LB)/CP/F	HDIP 14-P-500A HSOP 20-P-450	26V 1.2A	3-phase bi-directional driver, current control type	43
	TA7247AP	HDIP 20-P	38V 1.5A	3-phase bi-directional driver, voltage control type, SW regulator controller incorporated	57
	TA7248P	HDIP 20-P	35V 0.9A	3-phase bi-directional driver, current control type	68
	TA7259P/P (LB)/F	HDIP 14-P-500A HSOP 20-P-450	26V 1.2A	3-phase bi-directional driver, current control type	80
	TA7260P	HDIP 14-P-500A	35V 0.9A	2-phase bi-directional driver, current control type	85
	TA7261P	HDIP 14-P-500A	25V 0.6A	2-phase bi-directional driver, current control type	94
	TA7262P/P (LB)/F	HDIP 14-P-500A HSOP 20-P-450	25V 1.5A	3-phase bi-directional driver, voltage control type	100
	TA7284P	HDIP 24-P-500	24.5V 0.6A	2-phase bi-directional F-servo single-chip driver	124
	TA7735N/F	SDIP 24-P-300 SSOP 24-P-300	18V 1.2A	Hall-sensorless 3-phase unipolar driver, SW regulator incorporated	204

Equipment	Model	Package	Max. rating	Functions	Page
Hallmotor driver	TA7736P/F	DIP 16-P-300A HSOP 16-P-300	26V 1.0A	3-phase bi-directional driver, current control type	215
	TA7745P/F	DIP 16-P-300A SSOP 16-P-225A	18V 1.0A	Low-voltage 3-phase unipolar (bi-directional) driver, voltage control type, bi-directional drive possible by external transistors	225
	TA8402F	HSOP 20-P-450	18V 1.0A	Same as TA7745P/F, control amplifier incorporated	271

(5) Linear actuator (TA7256P)

2-2 Stepping Motor IC's

TA8425H	PWM chopper type 2-phase full-wave quasi-sinusoidal, microstep, 40V, 1.5A
TA8435H	Same as TA8425H, provided with reset and monitor terminals
TB6504F	Same as TA8435H, 10V, 150mA
TA8411L	PWM chopper-type 2-phase full-wave system driver (2 × stepping motor, 1 × DC motor control), 27V, 0.8A × 2, 27V, 0.6A × 1
TB6500AH	Same as TA8411L
TA7289P/F	PWM chopper-type driver with 4-bit DAC, 30V, 0.7A
TA7774P/F	2-phase full-wave dual-powered driver, provided with power saving function, 7-17V, 0.35A (for FDD)
TA8430AF	2-phase full-wave, low-voltage driver, 8V, 0.6A (for FDD)
TA8437F	2-phase full-wave, smart MOS, 6V, 0.3A × 2
TA8459F	2-phase full-wave, smart MOS, 6V, 0.3A × 2
TA8529F	1-, 2-, 1-2 phase excitation bipolar, 5V/12V, 0.4A × 2

TD62803P	3-/4-phase, 1-, 2-, or 1- 2-phase excitation unipolar controller driver, 7 or 28V, 0.4A
TA8415P	Same as TD62803P

TD62064BP-1	80V, 1.5A, 4-channel transistor array
TD62164BP	80V, 0.7A, 4-channel transistor array
TD62308BP-1	80V, 1.5A, 4-channel transistor array
TD62318BP	80V, 0.7A, 4-channel transistor array
TD62081~4AP/AF	50V, 0.5A, 8-channel transistor array
TD62386~8AP/AF	50V, 0.5A, 8-channel transistor array
TD62C851P	50V, 0.2A 8-channel shift-register latch driver
TD62C852P	50V, 0.5A 8-channel shift-register latch driver
TD62M4700F	10V, 2A transistor array
TD62M2702F	10V, 2A transistor array
TA7257P	25V, 1.5A bridge driver
TA7267BP	25V, 1.0A bridge driver
TA8409S/F	25V, 0.4A bridge driver
TA7291P/F/S	25V, 1.0A bridge driver
TA7279AP	25V, 1.0A bridge driver (dual)
TA8428K	30V, 1.5A bridge driver
TA8429H	30V, 3.0A bridge driver

Used for unipolar motor

Used for bipolar motor

(1) Stepping motor system driver for facsimile and word processor (TB6500AH), PWM chopper type

* Similar models can be developed by Toshiba.

(2) General-use stepping motor drive circuit (TA8415P + TD62308AP/BP-1)

(3) Micro step driver for PPC and printer (TA8435H), PWM chopper type

(4) Low-voltage high-efficiency stepping motor drive circuit (TD62M4700F x 2)

(5) Large-current stepping motor drive circuit (TA8429H x 2)

2-3 Hall Motor IC's

(1) Current control type motor driver (TA7259P/F)

(2) Voltage control-type motor driver (TA7262P/F)

(3) Motor controller (TA7712P)

(4) Fan motor (TA8420AF)

2-4 Bridge Driver IC's

TA7354P	18V, 0.2A, single
TA7733F	18V, 0.5A, low-voltage, single
TA7291P/S/F	25V, 1.0A, output voltage adjustable, single
TA8409S/F	25V, 0.4A, output voltage adjustable, single
TA7267BP	25V, 1.0A, single
TA8102P	15V, 1.0A, low-voltage dual-power operational amplifier with boot strap
TA7288P	25V, 1.0A × 2, output voltage adjustable, sequential dual
TA7279AP	25V, 1.0A × 2, dual
TA7257P	25V, 1.5A, single
TA7256P	±18V, 0.5A, dual-power operational amplifier
TA8406P/F	±18V, 0.5A, dual-power operational amplifier
TA8410P/K/F	±9V, 0.6A, dual-power operational amplifier
TA8410AK	±15V, 0.6A, dual-power operational amplifier
TA8428K	30V, 1.5A, single, overcurrent protector circuit incorporated
TA8429H	30V, 3.0A, single, overcurrent protector circuit incorporated
*TA8440H	50V, 1.5A, single
TA8436F	7V, 1.0A, single, smart MOS H-switch
TA8437F	6V, 0.3A × 2, dual, smart MOS H-switch
TA7272P	±18V, 1.2A, dual-power operational amplifier
TA8407P/F	±18V, 1.2A, dual-power operational amplifier
TA8212F	14.5V, 1.2A, quad-power operational amplifier
TA8449P	±15V, 0.6A, quad-power operational amplifier
TA8464K	±18V, 1.2A, dual-power operational amplifier, high slew rate.
TA8459F	6V, 0.3A × 2, dual smart MOS H-switch
TA8460F	6V, 0.3A × 2, dual smart MOS H-switch, with PWM pre-driver
TB6501F	20V, 0.4A, single with rotation detector
TA8461F	±15V, 1.5A, dual-power operation amplifier

* Under development

TD62M4700F	10V, 2A Low-voltage drive, low-saturation voltage bridge driver
TD62M2701F	10V, 2A Low-voltage drive, low-saturation voltage bridge driver
TD62M2702F	10V, 2A, Low-voltage drive, low-saturation voltage bridge driver
MP4500 series	Power transistor module
MG15G4GL1 and others	Giant transistor module
MG15D4GM1 and others	Giant transistor module

(1) Output voltage adjusting-type single-bridge driver (TA7291P/F)

* TA7291S of SIP 9-pin type and improved TA8409S/F are also available.

(2) Output voltage adjusting-type sequential dual-bridge driver (TA7288P)

(3) Low-voltage (less than 3V) large current (2A) miniature bridge driver (TD62M4700F)

(4) Large current single-bridge driver (TA8429H)

(5) Single-bridge driver (TA8428K)

(6) Linear bridge driver (dual-power operational amplifier) (TA7272P)

* TA8407P/F, TA8406P/F, TA7256P, TA8410K/P/F, TA8410AK etc. are available for various maximum ratings and packages. High slew rate type TA8464K is available.

2-5 Hybrid IC's and Multichip IC's

Demands for increased compactness, lighter weight, and further enhanced reliability of devices are stimulating efforts to achieve higher densities of semiconductors. There are also calls for stable operations under unfavorable conditions such as high temperature and high humidity. Properties for system parts and functional units are required of hybrid IC's. Also, increased integration can be achieved by using the MCP (multichip process), a technique for packaging a discrete transistor, diode, C-MOS IC, and bipolar IC chips into one IC package.

○ Features

- Hybrid and multichip IC's are applicable to ASIC, permitting various applications in accordance with user's needs.
- If the IC's, transistors, and diodes are Toshiba semiconductors, they are applicable, except for certain ones that cannot be contained in single packages for reasons involving manufacturing technique.
- For multichip IC's, all Toshiba packages, except for certain ones already on the market, can be used. For packages, refer to the Package Manual issued by Toshiba.
- For multichip IC's, for motors, not only those for ASIC, but also general-purpose models such as the transistor array series (TD62MXXXX series) having several discrete transistors packed in each IC package, as well as PLL-PWM motor controllers, TA8443F, are available on the market.

- Multichip IC's and hybrid IC's for motor control

For PLL-PWM motor control, TA8443F is being marketed. The former contains TC9203P (PLL IC), TA7649P (for PWM switching regulator IC), and TA7712P (for 3-phase hall motor control) in one package.

○ PLL-PWM motor drive circuit for PPC (TA8443F)

- Multichip transistor array series

		H-bridge connection	3-phase connection	4-channel	8-channel
Single type	Source	—	TD62M3600F (10V, 2.0A)	TD62M4600F (10V, 2.0A)	TD62M8600F (10V, 2.0A)
		—	TD62M3601F (30V, 1.5A)	TD62M4601F (20V, 2.0A)	TD62M8601F (20V, 2A)
		—	—	—	TD62M8603F (30V, 1.5A)
	Sink	—	—	TD62M4500F (10V, 2.0A)	TD62M8500F (10V, 2.0A)
		—	—	TD62M4501F (20V, 2.0A)	TD62M8501F (20V, 2.0A)
		—	—	—	—

		TD62M2701F (10V, 2.0A)	TD62M3701F (10V, 2.0A)	—	—
		TD62M2702F (10V, 2.0A)	TD62M3702F (15V, 2.0A)	—	—

* Incorporated several discrete transistor chips with excellent properties in one package. Ideal for circuits requiring low-saturation properties.

3. APPLICATIONS

3. APPLICATIONS

3-1 Applications List

Electronic equipments contains their own main and auxiliary drives; their motor types and drive circuits are selected in accordance with the necessary properties for such parts.

The following are application circuits considered most common, listed for devices.

	Equipment	Function	IC used	Recommendable IC's
OA	Floppy disk drive (FDD)	Controller	Mechanism controller	TC8605F(C), TC8615F-002 TC8606F-000, TC8616F-002
		Spindle	Single chip	TA8434F, TA8463F
			Servo	TC9142AP, TC9203AP/AF(PLL), TA7715P(F servo)
			Hall motor	TA7736P/F (3.5), TA7259P/F (5.25), TA8424F
		Head	Stepping motor	TA7774P/F, TA8430AF, TA62003F
			Voice coil motor	TA7256P, TA7272P, TA8406P/F, TA8407P/F
	Hard disk drive (HDD)	Controller	Mechanism controller	TC8561F
		Spindle	Single chip	TA8434F
			Servo	TC9193AF, TC9142AP, TC9203AP/AF
			Hall motor	TA7736P/F (3.5), TA7259P/F (5.25), TA8423F
		Head	Stepping motor	TA7774P/F, TA7289P/F
			Voice coil motor	TA7272P, TA8407P/F
	Printer	Carriage	Stepping motor	TD62803P, TA7289P/F, TA8425H, TA8435H
		Feed (paper, typing ribbon)	Stepping motor	TD62803P, TA7289P/F, TA8425H, TA8435H
		Daisy wheel drive	Stepping motor	TA7289P/F, TA7774P/F, TA8430AF
		Polygon mirror drive (for laser printer)	Servo	TC9142AP, TC9203AP/AF
			Hall motor	TA7248P, TA7259P
	Optical disk	Spindle	Servo	TC9142AP, TA9203AP/AF
			Hall motor	TA8423P/F, TA7259P/F
	Facsimile (FAX)	Feed	Stepping motor	TA7289P/F, TB6500AH(system driver)
		Cutter	Bridge driver	TA7279AP, TA7267BP
	Electronic typewriter	Carriage	Stepping motor	TA7289P/F, TA8415P, TA8425H, TA8435H
		Ribbon feed	Stepping motor	TA7289P/F, TA7774P, TA8415P
		Paper feed	Stepping motor	TA7289P/F, TA7774P/F, TD62803P, TA8425H
			Bridge driver	TA7279P, TA7267BP, TA7291P
		Daisy wheel	Stepping motor	TA7289P/F, TB6500AH(system driver)
	Copier	Drum	Hall motor	TA8443F, TA8412P, TA7712P
		Lens, mirror	Stepping motor	TA7289P/F, TA8425H, TB6500AH, TA8415P
			Hall motor	TA7712P, TA8412P
		Scanner	Stepping motor	TD62803P, TA7289P/F, TA8415P
		Toner hopper	Bridge driver	TA7291P
		Heat roller	Hall motor	TA7712P, TA8412P, TA8443F,
		Fan	Hall motor	TA7247AP, TA7284P/F, TA8414P F, TA8420AF
		Paper feed	Hall motor	TA7712P, TA8412P
			Stepping motor	TD62803P, TA7289P/F, TA8415P
Electric home equipment	Wordprocessor	Printer	Stepping motor	TB6500AH(system driver)
	Fan motor	Fan	Hall motor	TA8420AF, TA8414P/F, TA7247AP
	Camera	Film feed, lens control	Bridge driver	TA7733F, TA8401F, TD62M4700F
	Air conditioner	Fan	Hall motor	TA7247AP, TA8414P F
	Fan heater	Fan	Hall motor	TA7284P, TA7247AP
	Sewing machine	Stitching, cloth feed	Stepping motor	TA8415P, TA7289P, TB6500AH

	Equipment	Function	IC used	Recommendable IC's
AV	Video cassette recorder (VCR)	Controller	Servo	TD6360N/F, TD6320N
		Capstan	Hall motor	TA7259P/F, TA7745P/F, TA7262P/F, TA8402F, TA8423P/F, TA8424F, TA8416F
		Drum	Hall motor	TA8402F, TA7259F, TA7736P/F, TA7735F, TA8423P/F, TA8424F, TA8416F
		Reel	Hall motor	TA7259P/F, TA7262P/F, TA8423P/F

* TA7272P and TA8410K/AK can be applied similarly. (Also, use TA8406P/F, TA8407P/F, and TA8410P/F, with different packages, depending on applications.) High slew rate type TA8464K is available.

4. DATA SHEETS

TA7245BP/BP(LB)/CP/F

DC MOTOR DRIVER IC.

The TA7245BP/CP are 3-phase Bi-directional motor driver IC.

It is designed for use VTR, tape deck, floppy disk and record player motor drivers.

It contains output power drivers, position sensing circuits, control amplifier and CW/CCW control circuit.

- . 3-Phase Bi-Directional Driver and Output Current Up to $\pm 1.2A$.
- . Few External Parts Required.
- . Wide Operating Supply Voltage Range
: $V_{CC(opr)}(MIN.)=7V$
- . Forward and Reverse Rotation is Controlled Simply by Means of a CW/CCW Control Signal Fed Into 10 PIN.
- . High Sensitivity of Position Sensing Amplifier.
($V_H=10mV(Typ.)$, Recommend to Use TOSHIBA Ga-As Hall Sensor "THS" Series.)
- . Surge Protect Diode Connected for All Input Terminals.
(Position Sensing, Control, CW/CCW Control Inputs.)
- . DIP-14F (TOSHIBA 5D14BP-P) Power Package.

TEST CIRCUIT 1

TEST CIRCUIT 2

INPUT/OUTPUT CHARACTERISTICS

V_{NF} shows voltage drop at R_F .

That is, in the case of star connection, when coil current is I_L ,

$$V_{NF} = R_F \cdot I_L$$

See the following circuit.

Further, if inputs (11 pin, 12 pin) are shorted or $V_{11} \geq V_{12}$, torque at the circuit becomes zero. However, this zero torque state also can be obtained by setting FRS input (10 pin) to specified voltage or by placing the circuit in open state and this is rather advantageous as current consumption is less.

FUNCTION

FRS (CW/CCW/STOP) INPUT	POSITION SENSING INPUT			OUTPUT		
	H _a	H _b	H _c	L _a	L _b	L _c
L	1	0	1	H	L	M
	1	0	0	H	M	L
	1	1	0	M	H	L
	0	1	0	L	H	M
	0	1	1	L	M	H
	0	0	1	M	L	H
H	1	0	1	L	H	M
	1	0	0	L	M	H
	1	1	0	M	L	H
	0	1	0	H	L	M
	0	1	1	H	M	L
	0	0	1	M	H	L
M	1	0	1	High Impedance		
	1	0	0			
	1	1	0			
	0	1	0			
	0	1	1			
	0	0	1			

Note: "1" of the hole element input means that voltage above +10mV is applied to the positive side of each hall element from the negative side and "0" means that voltage above +10mV is applied to the negative side from the positive side. In this case, needless to say, DC potential must be within the specified common mode voltage range of hall element input.

Further, "H", "M" and "L" of output mean $V_{CC}-V_{SAT1}=1/2 V_{CC}$ and V_{SAT2} , respectively, and "L", "H" and "M" of FRS input mean application of voltage within specified values of V_F , V_R and V_S , respectively.

Further, by applying required voltage for control input (V_{IN+} , V_{IN-}), measure the circuit in operating state.

TA7245BP/BP(LB)/CP/F

TA7245BP APPLICATION CIRCUIT 1

- * 1 V_Z of a ZENER diode should be decided in accordance with the DC level of control signal input. ($V_Z=2.5\sim 9V$. If temperature characteristic is to be taken into consideration, 5V is recommended. Further, DC potential at the negative control input 11 pin becomes $V_Z+R_F\cdot I_L$)
- * 2 As to R_F , although it should be decided according to coil impedance, F/V converted voltage (control input) and required starting torque, it is recommended to set at $0.3\sim 5\Omega$.
- * 3 Connect, if required.

APPLICATION CIRCUIT 2

TA7245BP/BP(LB)/CP/F

CONTROL SIGNAL INPUT METHOD

Normally, control voltage which is proportional to (or inversely proportional to) rotation speed (F/V converter etc.) is fed into the front stage of the TA7245BP differentially or single polarity. The gain from control input of the TA7245BP to output (at R_F terminal) is 5.5 times as indicated in the specification. It is however possible to improve characteristic of W/F, etc. by reducing the gain with NF applied.

It's application example is shown in the diagram below. Further, when NF is applied (Also, when not applied), it is necessary that DC voltages (V_{11}, V_{12}) of control inputs (11 pin, 12 pin) are within the range of values ($2.0 \sim V_{CC} - 2.5V$) shown in the standard. In addition, when input DC level and F/V converted output (control output) cannot be matched with IC input, a DC level shift diode and attenuator should be inserted in front of IC input. An example is shown in Fig. 1-c.

a) IN CASE OF POSITIVE INPUT

$$(N \propto \frac{1}{V_{cont}})$$

b) IN CASE OF NEGATIVE INPUT

$$(N \propto V_{cont})$$

DC level of control output is shifted by a zener diode and control signal output is attenuated by R_1 and R_2 .

POSITION SENSING ELEMENT DRIVING METHOD

The TA7245BP has a wide range of common mode voltage range (the specification is 2 to $V_{CC}-2.5V$ and therefore, 2 to 9.5V when $V_{CC}=12V$) of the position sensing element (generally, a hall sensor) input and therefore, both the constant current drive and constant voltage drive of a hall sensor are applicable.

As a hall sensor, Toshiba Ga-As hall sensor THS series are recommended.

When compared with In-Sb hall sensor, the Ga-As hall sensor has various merits such as excellent mechanical strengths, temperature stability and less saturation characteristic to magnetism and current.

However, it is considered that use of this sensor was so far difficult as it's sensitivity is lower than In-Sb hall sensor. On the TA7245BP in order to make it possible to use the Ga-As hall sensor which has merits on almost all items except sensitivity, sensitivity of the position sensing amplifier has been increased with less offset voltage. Further, if W/F characteristic is poor, increase of hall input may be effective in some cases. (However, be careful not to exceed max. allowable input).

POSITION SENSING ELEMENT
DRIVING METHOD (1)

(2)

(For details refer to the technical data for Toshiba Ga-As hall sensor THS series.)

CAUTIONS IN APPLICATION

IC for motor drive have several high impedance input terminals such as hall element input, control signal input, etc. and to handle a switched high output current. Because of such a reason. Care should be taken not to make a parasitic oscillation path caused by unnecessary feedback.

Further, as load is a coil, it is necessary to pay attention to prevent destruction by impulse at time of ON/OFF, particularly, application of voltage and current in excess of standard values to the output transistor when supply voltage is at high level ($V_{CC}=18V$ or above). It is recommended to use the TA7245BP at supply voltage below 12V and the TA7245CP at below 18V. If they are used supply voltage above these values, the above-mentioned cautions should be followed.

(1) CAUTIONS FOR RELIABILITY DESIGN

- a) Do not into the output transistor inside IC into the high voltage and current operating region.
(Especially, when a motor is locked, V_{CC} is ON/OFF, output is shorted, etc.)
- b) It is desirable to design the output ringing absorbing capacitor in capacitance as small as possible (the output transistor may be destructed by charging/dis-charging current of this capacitor in some cases).
If it becomes a problem, it is recommended to review not only capacitance but also connecting point and connecting method (delta or star connection) in addition to taken an oscillation preventing measure described later furthermore, to insert resistor (3Ω to 30Ω) in series to the capacitor.
- c) In installing to a printed circuit board, be careful not to apply an abnormal force to the fin of IC and moreover, to solder in several seconds (at $260^{\circ}C$).
- d) It is an effective method for assuring reliability to provide a large earthing area on a printed circuit board to promote heat-radiation from the soldered fin of IC.

(2) CAUTIONS FOR WIRING

It is recommend to design a print pattern with the following methods taken into consideration in order to prevent parasitic oscillation.

- a) The output coil current path line should be provided separately from other earth one because the coil current includes switched high current. In particular, it is recommended to design a line from R_F terminal (5 pin) to the earth so that it's impedance does not become common to other circuits. (This is especially important.)
- If this is not possible or oscillation cannot be eliminated completely, it is advised to connect a capacitor of $0.001 \sim 0.1 \mu F$ parallelly with R_F .

Fig. 2

- b) It is also recommended to provide the hall element drive current path independently. (Especially, separately from the output current path) Further, if plunging input to the position sensing element is expected, it is advised to insert a capacitor of $0.05 \sim 1 \mu F$ between the plus (+) and minus (-) terminals of each position sensing input.

In addition, it should be also consider to insert resistors in series to all hall element inputs. If plunging input to control input is expected, connect a capacitor of $0.001 \sim 0.1 \mu F$ between control terminal and GND.

Fig. 3

- c) If parasitic oscillation in a high frequency range above 5MHz is observed, commonly connect the capacitors from all coil outputs and connect a capacitor ($C=0.01\sim 0.1\mu\text{F}$) to R_F terminal (5 pin) from this connecting point (Fig. 4-a). Further, it is also recommended to consider a method to connect capacitors to R_F terminal from respective coil outputs separately from the ringing absorbing capacitor (Fig. 4-b).

Fig. 4-a

Fig. 4-b

- d) It is recommended to connect a path capacitor directly from V_{CC} terminal (9 pin) without giving common impedance to GND. Further, it is also effective to insert C_2 ($0.01\sim 0.1\mu\text{F}$).

Fig. 5

(3) CONNECTION OF OUTPUT RINGING ABSORBING CAPACITOR

It is advised to connect the output ringing absorbing capacitor to GND from each coil terminal. In addition, it is also advised to consider the following methods from the viewpoint of parasitic oscillation prevention as well as destruction prevention.

- a) Change of capacitance
- b) Delta connection (Fig. 6-a)
- c) Connection to V_{CC} instead of GND (Fig. 6-b). In this case, however, attention should be paid to destruction. If voltage/current locus is outside ASO, it is necessary to connect resistors in series with capacitors.

And propose to connection to R_F terminal.

- d) Connect resistors in series with capacitor (Fig. 6-c).
- e) Combination of a), b), c) and d).

Fig. 6-a

Fig. 6-b

Fig. 6-c

OTHER CAUTIONS

Depending upon capacity and connecting method of the output capacitor, the output transistor inside IC may be destructed in some cases and it is therefore recommended obtain voltage/current locus of the output transistor through the measurement shown below and confirm that the locus is within ASO. (Especially, the measurement at time of SW ON/OFF, CW rotation→CCW rotation→CW rotation is important).

Fig. 7

TA7247AP

DC MOTOR DRIVER.

The TA7247AP is a 3-phase Bi-directional supply-voltage-controlled motor driver IC providing all the active functions necessary for switching-regulator-controlled FAN MOTOR of electrical Air conditioner.

It's designed for especially energy saving air conditioner applications and suitable for use any other motor driver applications.

It contains 3-phase Bi-directional power driver, CW/CCW control circuit, comparator and oscillator for switching regulator, and protect circuits.

Weight: 8.2g (Typ.)

FEATURES:

- . Voltage Controlled 3-Phase Bi-Directional Motor Power Driver.
- . Output Current Up to 1.5A.
- . High Sensitivity of Position Sensing Inputs
: $V_H=40\text{mV}$ (Typ.)
- . Built in Over Current, Over Voltage, Low Voltage and Thermal Protect Circuit..
- . More Power-up Applications with Additional Power Transistors.
- . Recommended Supply Voltage : $V_{CC1}=30\text{V}(\text{Max.})$
 $V_{CC2}=5\text{V}$

FUNCTION

a) FORWARD ROTATION MODE (PIN 18 Open or 2.5V Min.)

b) REVERSE ROTATION MODE (PIN 18 GND or 0.4V Max.)

APPLICATION OF TA7247AP

(1) DESIGN METHOD OF SWITCHING REGULATOR OSCILLATION CIRCUIT (PWM generating circuit).

The PWM wave generating circuit that controls the switching regulator output switching transistors is shown in Fig. 2.

The circuit consists of a triangular waveform generating circuit that generates a comparison signal and a comparator that compares the comparison signal from the triangular waveform generating circuit with output voltage from the switching regulator. (In the example shown in Fig. 2, output level is such that "H" level is at V_{CC2} level ($\div 5V$) and "L" level is typically at 0.5V as specified in the standard.)

In this oscillation circuit, positive feedback is added to the differential comparator to provide hysteresis. "H" and "L" levels of triangular waveform output are expressed, respectively, by the following equations:

$$V_{CR \text{ MAX.}} = \frac{R_2 + R_3}{R_1 + R_2 + R_3} \cdot V_{CC2} \div 2.69V$$

$$V_{CR \text{ MIN.}} = \frac{R_2}{R_1 + R_2} \cdot V_{CC2} \div 1.25V$$

Q_1 shown in Fig. 2 is for a discharge path and R_4 decides discharging time constant together with an external capacitor C_f .

Fig. 1 TRIANGULAR WAVEFORM GENERATING CIRCUIT OUTPUT WAVEFORM (Pin (19))

Further, oscillation periods t_0 and t_1 are decided by the following equations:

$$t_0 \div 0.4845 \cdot C_f \cdot R_f \text{ (sec)}$$

$$t_1 \div 0.7664 \cdot C_f \cdot R_4 \text{ (sec)}$$

Where, R_4 is an internal resistor ($\div 1.3k\Omega$)

Further, as resistance of the resistor R_4 in IC varies by about $\pm 20\%$, it is recommended to use R_4 in actual application at $R_f \gg R_4$ to suppress internal fluctuation of resistance in IC at the minimum level.

Fig. 2 PWM WAVEFORM GENERATING CIRCUIT

The comparator circuit consists of a differential amplifier which is operated by PNP differential input.

DC level to the C^+ terminal is decided by DC level at the CR terminal (Pin (19)) and required duty ratio.

As DC level at the CR terminal is 1.25~2.67V as shown in Fig. 1, it is recommended to input DC at a level corresponding to DC level at the CR terminal.

Further, R_f and Triangular waveform oscillation period characteristic is shown in Fig. 3 and PWM output waveform duty ratio vs. (20) pin voltage characteristic in Fig. 4.

Fig. 3 R_f -OSCILLATION PERIOD CHARACTERISTICFig. 4 DUTY RATIO- V_C CHARACTERISTICS

(2) POSITION DETECTING CIRCUIT (Hall element input circuit)

The Position detecting circuit is shown in Fig. 5. This circuit consists of a differential amplifier having hysteresis (≈ 20 mV, typical).

As operating DC level (CMR) is about 1.5 V at the lower side and $V_{CC} - 1.8$ V at the upper side, it is recommended to input constant voltage drive from V_{CC2} at level higher than hysteresis by 3 times or more (60 ~ 70 mV).

If the hall element is removed during the rotation, IC can be destructed.

Fig. 5 POSITION DETECTING CIRCUIT (Hall element input)

(3) FORWARD/REVERSE ROTATION SELECTOR CIRCUIT

The forward/reverse rotation selector circuit is shown in Fig. 6. The forward rotation (or reverse rotation) is resulted when Pin (18) is opened (or at 2.5V or above), while the reverse rotation (or forward rotation) is resulted at GND (or at 0.4V or below).

Fig. 6 FORWARD/REVERSE ROTATION SELECTOR CIRCUIT

SW	
ON	OFF
L	H
H	L
CCW	CW
(R)	(F)

(4) OUTPUT CIRCUIT

The output circuit is shown in Fig. 7. The upper side of the circuit (Pins (5), (7) and (0)) is for outlet, while the lower side (Pins (4), (6) and (8)) is for intake. When the built-in output transistors are used, Pins (4) and (5), (6) and (7), and (8) and (9) shall be shorted, respectively.

When transistors are externally mounted for increasing the capacity largely, they shall be connected as shown in Fig. 7.

Fig. 7 OUTPUT CIRCUIT

(5) PROTECTIVE CIRCUITS

a) Over Voltage Protective Circuit

If voltage at V_{CC1} terminal exceeds normal voltage (38V), Q_2 in Fig. 2 is ON to inhibit PWM output and at the same time, the output circuit is OFF.

b) Thermal Shut Down Circuit

If temperature at the junction point exceeds specified temperature (150°C), similar to a), above, Q_2 in Fig. 2 is ON to inhibit PWM output and at the same time, the output circuit is OFF.

c) OVER CURRENT PROTECTIVE CIRCUIT

If V_{RSC} in Fig. 7 exceeds specified voltage ($V_{RSC} = R_{SC} \cdot I_{SC}$), the output circuit is OFF.

d) Excessively Low Voltage Protective Circuit

If voltage at V_{CC1} terminal drops below specified voltage, the output circuit is

OFF. Further, this circuit is a malfunction preventive circuit.

APPLICATION CIRCUIT

Note : In case of the open-loop control by CPU, rotating speed is controlled by the rotation control signal (analog output) from CPU. However, the closed-loop control by the feedback signal taken from the switching regulator output is also possible.

In this case, the connection shall be made as shown in the above circuit diagram.

is

TA7248P

DC MOTOR DRIVER

The TA7248P is a DC motor (3 phase) driver IC.
It contains regulator, position sensing amplifiers,
control amplifier, quick stop circuit and drivers.
Maximum output current (Bi-direction) of driver is
 $\pm 900\text{mA}$ (average).

Hall element is used as a position sensor.

By combining this IC and TA7674P (or TA7715P) F-servo
motor driver system is available.

FEATURES:

- . Driver for Hall Motor (3 phase)
- . Large Output Current (Bi-direction)
: $I_O = \pm 900\text{mA}$ (average)
- . Built-in Reverse Rotation Detector and Quick Stop
Circuit.
- . Regulator for External Circuits
: $V_{OUT} = 10.7\text{V}$, $I_O = 50\text{mA}$
- . Operating Supply Voltage : $V_{CC} = 16 \sim 32\text{V}$

Weight: 8.2g (Typ.)

MAXIMUM RATINGS ($T_a = 25^\circ\text{C}$)

CHARACTERISTIC	SYMBOL	RATING	UNIT

TA7256P

DUAL POWER OPERATIONAL AMPLIFIER.

TA7256P is a dual power operational amplifier.
It is intended for use especially DC MOTOR positioning system applications such as, Arm Driver (for Audiodisk Players), head or voice coil motor drivers (for Floppy and Winchester Disk Drivers) and any other power driver applications.

FEATURES:

- . HSIP 10 Pin Power Package Capsealed.
- . Built-in Over Current Protector.
- . Few External Parts Required.
- . Output Current Up to 0.5 A.

Weight: 2.47g (Typ.)

TA7257P

BRIDGE DRIVER

The TA7257P is a Full Bridge Driver for blashed DC Motor Rotation control.

Forward Rotation, Reverse Rotation, Stop and Braking operations are available.

It's designed for Loading and Reel Motor driver for VTR and Tape Deck, and any other consumer and industrial applications.

TA7257P has Operation Supply Voltage terminal and Motor Driving Supply Voltage terminal independently therefore Servo control operation is applicable.

Weight: 1.9g (Typ.)

FEATURES:

- . Output Current Up to 1.5A(AVE.), and 4.5A(PEAK).
- . 4 Function Modes (CW, CCW, STOP and Brake) are Controlled by 2 Logic Signals Fed into 2 Input Terminals.
- . Built-in Over Current Protector and Thermal Shut Down Circuit.
- . Operating Voltage Range : $V_{CC}=6 \sim 18V$

Limitting Current		ISC		-	-	3.5	-	A
Input Current		IIN		Input GND	-	1	10	μA

APPLICATION NOTE

(1) INPUT CIRCUIT

Input circuit is shown in Fig-1. It's a "Low active" type voltage comparator that's one input connect to Input terminal (1, or 2 PIN) and the other to built-in temperature compensated voltage reference ($V_{TH} = 1.4\text{V Typ.}$)

If a voltage above $V_{IN(H)}$ fed into the Input Terminal that means "Logic 1" and less than $V_{IN(L)}$ or connect to GND means "Logic 0".

(Fig.-1)

(2) BASIC APPLICATION CIRCUIT

Fig-2 shows the basic application circuit.

Optimum values of the C, R depend on the inherent constant of a motor and parasitic C,R values around the circuit.

Normally, recommended to use $0.1\mu\text{F}$ and 33Ω .

(Fig.-2)

(3) ADDITIONAL DIODE

I) If the braking operation is so loose, connect a additional diode between each output to GND, (See Fig-3(a))

II) If the back electromotive pulse generated in output coil is so strong. Internally connected back electromotive suppression diode may be damaged by this pulse.

In such a case connect a additional diode between each output to V_{CC} .

(See Fig-3-(b))

Fig 3-(a)

Fig 3-(b)

TA7259F/P/P(LB)

DC MOTOR DRIVER IC.

The TA7259P is a 3-phase Bi-directional motor driver IC. It designed for use VTR tape deck, floppy disk and record player moter drivers.

It contains output power drivers, position sensing circuits, control amplifier and CW/CCW control circuit.

- . 3-Phase Bi-Directional Driver and Output Current Up to $\pm 1.2A$.
- . Few External Parts Required.
- . Wide Operating Supply Voltage Range :
: $V_{CC(opr)}(MIN.) = 7 \sim 20V$
- . Forward and Reverse Rotation is Controlled Simply by Means of a CW/CCW Control Signal Fed Into 10 PIN.
- . High Sensitivity of Position Sensing Amplifier.
($V_H = 10mV(Typ.)$, Recommend to Use TOSHIBA Ga-As Hall Sensor "THS" Series.)
- . Surge Protect Diode Connected for All Input Terminals.
(Position Sensing, Control, CW/CCW Control Inputs.)
- . DIP-14F (TOSHIBA 5D14BP-P) Power Package.
- . Second Version of TA7245BP
(It's have a better stability)

TA7259F/P/P(LB)

APPLICATION CIRCUIT

Note : The TA7259P is a second version of TA7245BP.

The main difference are PIN CONNECTION (PIN 8 and PIN 9 only) and stability.

Refer to TA7245BP Technical Data if you need further application data.

TA7260P

DC MOTOR DRIVER (2 PHASE Bi-DIRECTIONAL)

The TA7260P is a 2 Phase Bi-Directional type Motor Driver IC designed for use Floppy Disk, VTR and Tape Deck Motor Drivers.

It contains Output Power Drivers, Position Sensing Amplifiers, Control Amplifier and Voltage Regulator for external circuit.

FEATURES:

- . Output Current is up to 0.9A(AVE).
- . Built in Reverse Rotation Detector.
- . Voltage Regulator for External Circuit
: $V_{OUT}=10.7V$ (Typ.), $I_O=50mA$ (Max.)
- . Few External Parts Required.

BLOCK DIAGRAM

TEST METHOD

(1) I_{CC} (Quiescent Current)

Use Measuring Circuit 1, $e_1 \sim e_4$ are specified in Table (Condition 1) e_5, e_6 are in Table 2 (Condition 1).

To measure a supply Current

(2) V_{IO} (Input Offset Voltage), V_{ID} (Input Dead Band), V_{OR} (Residual Output Voltage), G_V (Voltage Gain) (Refer to Input-Output Characteristics)

$e_1 \sim e_4$ are specification in Table 1 (Condition 1) and e_5 is 5.5V DC.

Measuring Procedures are follows.

- a) Increase a e_6 voltage gradually from 5V DC, Measure a Input Voltage V_1 when the output voltage V_2 is equal to 120mV.
(In this condition $V_1=E_1$, $V_1=V_6 - V_5$, $V_2=V_{Rf}=V_7 \sim V_2$)
- b) More Increase the e_6 Voltage
Measure the V_1 when the V_2 is equal to 20mV (In this condition $V_1=E_3$)
- c) Increase the e_6 Voltage 25mV above previous condition and measure the Input Voltage V_1 . (In this condition $V_1=E_3$)
- d) More increase the e_6 voltage gradually and measure the Input Voltage V_1 when the V_2 is equal to 120mV.
(In this condition $V_1=E_4$)

Electrical Characteristics are calculated by following equations.

$$V_{IO-} = E_2$$

$$V_{IO+} = E_4$$

$$V_{ID} = E_4 - E_2$$

$$V_{OR-} = E_3$$

$$G_{V-} = \frac{100}{E_2 - E_1} \text{ (mV)}$$

$$G_{V+} = \frac{100}{E_5 - E_4} \text{ (mV)}$$

- (3) $V_{SAT\ 1}$, $V_{SAT\ 2}$ (Output upper and lower side saturation voltage)
 e_5 and e_6 are specified in Table 2 (Condition 2) $e_1 \sim e_4$ and condition of SW_1 and SW_2 are specified in Table 1 (Condition 1, 2, 3, 4) Measure V_3 and V_4 for each specified conditions.
- (4) I_L (Leakage Current)
 Measure a output transistor leakage current
- (5) V_{CC2} (Built in Regulator output voltage)
 Measure the V_{CC2} (4 PIN) DC voltage with specified load condition.

APPLICATION

TA7262F/P/P(LB)

DC MOTOR DRIVER (3 PHASE Bi-DIRECTIONAL)

The TA7262P is a 3 Phase Bi-Directional supply-voltage-control Motor Driver IC. It's designed especially for energy saving Motor Control System. It contains Power Drivers, CW/CCW control circuit position sensing amplifiers and current regulator for external connected position sensing elements.

FEATURES:

- . Output Current is Up to 1.5A (AVE).
- . Supply Voltage Control Motor Driver.
- . Variable Current Source for Hall Sensor Including.
- . Few External Parts Required.
- . High Sensitivity of Position Sensing Inputs.

MAXIMUM RATINGS (Ta=25°C)

APPLICATION CIRCUIT 2

APPLICATION CIRCUIT 3

$$I_L \div \frac{b}{\gamma_a \cdot \gamma_c} \cdot V_{IN} - \frac{1}{\gamma_c} \left(\frac{\gamma_b}{\gamma_a} \cdot V_{BE1} + V_{BE2} \right)$$

I_L : Motor Coil Current

V_{IN} : Control Voltage

$$I_L \div K_1 \cdot V_{IN} + K_2$$

$K_1, K_2 = \text{Constant}$

Q2 works as a Current Regulator for Output Coil. Therefore, Collector to Emitter Voltage of Q2 is varied in accordance with required coil current.

TA7267BP

BRIDGE DRIVER

The TA7267BP is a Bridge Driver for brushed DC Motor Rotation control.

Forward Rotation, Reverse Rotation, Stop and Braking operations are available.

It's designed for Loading and Reel Motor drover for VCR and Tape Deck, and any other consumer and industrial applications.

TA7267BP have Operation Supply Voltage terminal and Motor Driving Supply Voltage terminal independently, therefore Servo control operation is applicable.

Weight : 2.15g(Typ.)

- . Output Current Up to 1.0A(AVE), and 3.0A(PEAK).
- . 4 Function Modes (CW, CCW, STOP and Brake) are Controlled by 2 Logic Signals Fed Into 2 Input Terminals.
- . Built-in Over Current Protector and Thermal Shut Down Circuit.
- . Operating Voltage Range : $V_{CC}=6\sim 18V$

APPLICATION NOTE

(1) INPUT CIRCUIT

Input circuit is shown in Fig.1. It's a "High Active" type.

If a voltage above specified $V_{IN(H)}$ value fed into input terminal that means "Logic 1", and the voltage less than $V_{IN(L)}$ or connect to GND means "Logic 0".

And the circuit have a hysteresis for stable operation. (See Fig.2)

Fig. 1

Fig. 2

(2) BASIC APPLICATION CIRCUIT

Fig.3 shows the basic application circuit.

Optimum values of the C,R depend on the inherent constant of a motor and parastic C,R values around the circuit.

Fig. 3

(3) ADDITIONAL DIODE

I) If the braking operation is so loose, connect a additional diode between each output to GND. (See Fig.4-(a))

II) If the back electromotive pulse generated in output coil is so strong. Internally connected back electromotive suppression diode may be damaged by this pulse.

In such a case connect a additional diode between each output to VCC. (See Fig.-4(b))

Fig. 4(a)

Fig. 4(b)

TA7272P

DUAL POWER OPERATIONAL AMPLIFIER.

TA7272P is a dual power operational amplifier.

It is intended for use especially DC MOTOR positioning system applications, such as Arm Driver (for Audiodisk Players), head or voice coil motor drivers (for Floppy and Winchester Disk Drivers) and any other power driver applications.

FEATURES:

- . SIP 10 Pin Power Package Capsealed.
- . Build-in Over Current Protector.
- . Few External Parts Required.
- . Output Current Up to 1.2A Max. (AVE)
- . Excellent Crosstalk Characteristics.

Weight: 2.47g (Typ.)

TA7279AP/P

MEASURING CIRCUIT 3. $V_{SATU-1,2/L-1,2}$

MEASURING CIRCUIT 4. $V_{F-U,L}$

APPLICATION CIRCUIT

Note 1. Recommend to increase this value for stable operation when a proper PCB patterning is difficult to get.

Note 2. Care should be taken not to have a common impedance with another lines.

TA7284P

DC MOTOR DRIVER

TA7284P is a 1 CHIP MOTOR DRIVER IC designed especially for FDD and WDD Spindle Motor Control. It consists of Position Sensing Circuit, S/H type F/V Conversion Amplifier and 2 phase Bi-directional Power Outputs.

FEATURES:

- . 2-Phase Bi-directional 1 Chip Motor Driver
- . Output Current Up to 0.6A(AVE), 1.5A(PEAK).
- . $V_{CC(opr)} = 9 \sim 24V$
- . Built in Over Current and Thermal Shut Down Circuit
- . Regulator for External Circuit Including

Weight: 4.3g (Typ.)

TA7284P

BLOCK DIAGRAM

1. INTERNAL REGULATOR

7.4V Output Voltage is delivered for F/V Conversion reference and any other internal and external circuits by using Zener Diode and Power Transistor.

Maximum Output Current for external circuits is up 50mA.

Fig. 1 INTERNAL REGULATOR CIRCUIT

2. FG AMPLIFIER

Fig. 2 FG AMPLIFIER CIRCUIT

Fig. 3 FRONT AMPLIFIER

Input small FG signal is amplified to required level by FG Amplifier that has a open loop gain of 85dB(TYP.), and is wave shaped by Hysteresis Amplifier connected following stage. Closed loop gain of FG Amplifier can be changed by changing the value of external resistors. But, it is required to set a closed loop gain less than 40dB when the FG frequency is approximately 50Hz. FG frequency is approximately 500Hz or so high. In such a case, Closed loop gain is allowed to set less than 50dB. Front Amplifier (Fig.3) is required if the Closed loop gain is not enough. Capacitance and Resistor connecting between PIN 16 and GND is required for more stable operation. (Connect if required, See Fig.2)

3. POSITION SENSING CIRCUIT

Fig. 4 POSITION SENSING CIRCUIT

This circuit for sensing a relative position between rotor and stator by using Hall Sensor and output signal to Output Transistor circuit. The circuit is Differential Amplifier that has sensitivity of 200mV(p-p) and CMR (Operating DC Level) of $2 \sim V_{CC1} - 2V$.

4. CONTROL PULSE GENERATOR

Fig. 5 CONTROL PULSE GENERATING CIRCUIT

This circuit generates sampling and reset pulse required for Sample and Hold Circuit. The circuit consists of 3 Comparators that's one input is connect commonly to PIN 15 (C_t terminal) and other input to each Threshold Voltage Reference (2.1, 2.4 and 4.7V). Sampling Pulse is generated when the C_t terminal voltage is equal to 2.1V and Reset Pulse is generated when the terminal voltage is equal to 4.7V.

5. SAMPLE AND HOLD CIRCUIT

Fig. 6(a) SAMPLE AND HOLD CIRCUIT

Fig. 6(b) TIMING CHART FO S/H CIRCUIT

This Sample and Hold Circuit is used for F/V conversion by using Sampling and Reset pulse that generated in control pulse generating circuit. Sample and Hold Capacitance C_o is charged by V_{CC} through R_o . The C_o Voltage level is transferred to Hold Capacitance C_H when the Sampling Pulse is generated and discharged instantaneously by reset pulse.

6. VOLTAGE REFERENCE

Fig. 7 VOLTAGE REFERENCE

Voltage Reference for Servo Amplifier (=3.7V) is generated by V_{CC2} , dividing Resistors ($R_1(10k\Omega)$ and $R_2(10k\Omega)$ and Buffer Amplifier. Differential Voltage between V_{ref} (PIN 11 and V_O (PIN 10) become a F/V Output that fed into Servo Amplifier.

Fig. 9 TIMING CHART OF OUTPUT

Fig. 10 INPUT TO OUTPUT CHARACTERISTICS OF OUTPUT CIRCUIT

8. TOTAL OPERATION

Fig. 11 TIMING CHART

Locking frequency f_o is calculated by following equations.

$$1 - e^{-\frac{1}{C_o \cdot R_o} t} = \frac{1}{2}$$

$$t \doteq 0.6931 \cdot C_o \cdot R_o$$

$$f_o \doteq \frac{1.44}{C_o \cdot R_o} \text{ (Hz)}$$

$$C_o \cdot R_o \doteq \frac{1.44}{f_o}$$

C_t and R_t are required for generating Sampling and Reset Pulses only, therefore, not require precise values and any enviromental characteristics. But it is required to make the time constant of Sample and Hold Circuit ($=C_o \cdot R_o$) bigger than ten-times than that of Controle Pulse Generating Circuit ($=C_t \cdot R_t$).

$$C_o \cdot R_o \gg C_t \cdot R_t$$

Recommended value of Hold Capacitance C_H are approximately $0.1\mu F$ (for FG frequency is round 50Hz) and $0.05\mu F$ (for FG frequency is round 500Hz or higher), and recommend to use low leakage current type.

9. ETC

Care should be taken not to connect any other circuit with PIN 13 and PIN 14 .

APPLICATION CIRCUIT

FFD, WDD and AUDIO DISK PLAYER USE MOTOR DRIVER CIRCUIT

TA7288P

DUAL BRIDGE DRIVER

TA7288P is Dual Bridge Driver designed especially for VCR cassette and tape loading motor drives.

FEATURES:

- . 4 Modes Available (CW/CCW/STOP/BRAKE)
- . Output Current Up to 1.0A (AVE) and 2.0A (PEAK)
- . Wide Range of Operating Voltage
 - $V_{CC\text{ opr}}=4.5\sim 18V$
 - $V_S\text{ opr}=0\sim 18V$
 - $V_{\text{ref opr}}=0\sim 18V$
- . Build in Thermal Shutdown, Over Current Protector and Punch-Through Current Restriction Circuit.
- . Hysteresis for All Inputs.

APPLICATION CIRCUIT

Note: Connect if required

INPUT CIRCUIT

Input terminals of 4, 5 and 6 pin are all high active type and have a hysteresis of 0.7V typ. 5μA type of source mode input current is required.

OUTPUT CIRCUIT

Output voltage is controlled by V_{ref} voltage. Relationship between V_{OUT} and V_{ref} is $V_{OUT} = V_{BE} (\approx 0.7) + V_{ref}$

V_{ref} terminal required to connect to V_S terminal for stable operation in case of no requirement of V_{OUT} control.

TEST CIRCUIT 1

TEST CIRCUIT 2

TEST CIRCUIT 3

I_O calibration is required to adjust specified values of test conditions by $RL1 \sim RL3$.

PWM STEPPING MOTOR DRIVER

TA7289P/F are PWM solenoid driver designed especially for use high efficiency stepping motor control. It consist of 1.5A peak current drive capable output full bridge driver, oscillation circuit for PWM switching, 4 bit DAC for output current control and TTL compatible input circuit.

- . Wide Range of Operating Voltage: $V_{CC(opr)}=6\sim 27V$
- . High Current Capability : $I_O \text{ Max}=1.5A(\text{PEAK})$
- . LS-TTL Compatible Control Inputs(IN A, IN B)
- . Few External Components Required.
- . Build-in 4 bit DAC.

L	H	L	H	CCW/CW
H	H	off	off	∞

I_{DO} of current mode DAC output is proportional to multiplied voltage of V_{ref} (PIN ① (or ②①)) and DAC inputs. DAC inputs are all "low active" type and required input current of 300 μ A MIN for each input terminal.

3) OSC AND COMPARATOR

Fig. 3 OSC AND COMPARATOR CIRCUIT

Sawtooth OSC circuit consists of Q1 through Q4 and R1 through R3.

R1 and R2 are voltage divider of 5V build-in regulator.

Q1 is turned "off" when V_4 is less than the voltage of $2.5V + V_{BE} Q4 + V_{BE} Q3$ approximately equal to 3.8V. V_4 is increased by C1 charging of I_4 . Q1 and Q2 are turned "ON" when V_4 becomes $V_4 - H$ level.

Lower level of V_4 ($V_4 - L$) is equal to $V_{BE} Q4 + V_{BE} Q3 + V_{SAT} Q1$ approximately equal to 1.5V.

V4 is calculated by following equation.

$$V4 = 5 \cdot (1 - e^{-\frac{1}{C1 \cdot R3} t}) \dots\dots\dots 1)$$

Assuming that V4=1.5V(t=t1) and=3.8V(t=t2).

C1 is external capacitance connected to Pin ④ (or ⑤) and R3 is on-chip 20kΩ resistor.

Therefore, OSC frequency is calculated as follows.

$$t1 = -C1 R3 \ln (1 - \frac{1.5}{5}) \dots\dots\dots 2)$$

$$t2 = -C1 R3 \ln (1 - \frac{3.8}{5}) \dots\dots\dots 3)$$

$$f_{OSC} = \frac{1}{t2-t1} = \frac{1}{C1 (R3 \ln (1 - \frac{1.5}{5}) - R3 \ln (1 - \frac{3.8}{5}))}$$

$$= \frac{1}{21.4 C1} \text{ (kHz)} \quad (\text{Unit of } C1 \text{ is } \mu\text{F})$$

4) OUTPUT CIRCUIT

Fig.4 shows output circuit. Q11 and Q13 are power transistors that have current capability up to 1.5A PEAK.

Q12 and Q14 are driver transistors for each side. Q16 performs a inhibitor for lower side power block when upper side block "turned ON". And Q15 is for upper side one when lower side power block "turned ON".

Build-in Fly Diodes (D1 and D2) are connected in prallel with all power transistors.

Fig. 4 OUTPUT CIRCUIT

But, Care should be taken not to exceed maximum current value of these diodes. Especially, Upper side diodes are not so strong enough to prevent excess back electromotive force than that of lower side parastic made diodes. In case of low power applications there's no requirment of external Fly back diodes. But, We recommend to connect external diodes for all output to V_{CC} and GND to outputs terminals and check a V_{CE} and IC locus of output power transistors not to exceed a ASO in any cases for stable and reliable operations in case of high power applications.

APPLICATION CIRCUIT 1

Note 1 : Connect if required.

Note 2 : Recommended R_F value is approximately 200Ω .

And C_F value is concerned with the OSC frequency.

We recommend to select optimum value of C_F under the experimental consideration of noise cutting and time delay characteristics.

APPLICATION CIRCUIT 2

TA7291F/P/S

BRIDGE DRIVER

TA7291P/S are Bridge Driver with output voltage control.

FEATURES:

- . 4 Modes Available (CW/CCW/STOP/BRAKE)
- . Output Current Up to 1.0A(AVE) and 2.0A(PEAK) (TA7291P), and 0.4A(AVE) and 1.2A(PEAK) (TA7291S).
- . Wide Range of Operating Voltage: $V_{CC\text{ opr}}=4.5\sim20V$
 $V_S\text{ opr}=0\sim20V$
 $V_{ref\text{ opr}}=0\sim20V$
- . Built-in Thermal Shutdown, Over Current Protector and Punch=Through Current Restriction Circuit.
- . Stand-by Mode Available (STOP MODE)
- . Hysteresis for All Inputs.

TA7354P

BRIDGE DRIVER

The TA7354P is a Bridge Driver for brushed DC Motor Rotation control.

Forward Rotation, Reverse Rotation, Stop and Braking operations are available.

It's designed for Loading and Reel Motor driver for VTR and Tape Deck, and any other consumer and industrial applications.

TA7354P have Operation Supply Voltage terminal and Motor Driving Supply Voltage terminal independently, therefore Servo control operation is applicable.

FEATURES:

- . Output Current Up to 0.2A(AVE), and 0.6A(PEAK).
- . 4 Function Modes (CW, CCW, STOP and Brake) are Controlled by 2 Logic Signals Fed Into 2 Input Terminals.
- . Operating Voltage Range : $V_{CC}=6\sim 15V$

Weight: 0.92g (Typ.)

APPLICATION NOTE

(1) INPUT CIRCUIT

(Fig. 1)

Input circuit is shown in Fig.1. It's a "High Active" type.

If a voltage above specified $V_{IN(H)}$ value fed into input terminal that means "Logic 1", and the voltage less than $V_{IN(L)}$ or connect to GND means "Logic 0". And the circuit have a hysteresis for stable operation. (See Fig.2)

(2) BASIC APPLICATION CIRCUIT

Fig. 2 shows the basic application circuit.

Optimum values of the C, R depend on the inherent constant of a motor and parasitic C, R values around the circuit.

(Fig. 2)

(3) ADDITIONAL DIODE

- I) If the braking operation is so loose, connect a additional diode between each output to GND. (See Fig. 3(a))
- II) If the back electromotive pulse generated in output coil is so strong. Internally connected back electromotive suppression diode may be damaged by this pulse.
In such a case connect a additional diode between each output to V_{CC} . (See Fig. 3(b))

Fig. 3(a)

APPLICATION OF TA7712P/F

Like a video disk player, TA7712P/F is provided with the stopping function which in a short time, stops the motor having a large inertia, and makes the quick disk-change possible.

To make the frequency generator (FG) unnecessary which was formerly required for fetching the rotation signal, the signal from the position sensing input is ORed and is output to FG output pin (11/13 pin).

Therefore, for FG output, three position sensing outputs (Ha, Hb, Hc) are ORed, and the rotation speed signal of the frequency of six times that of one output can be fetched resulting in making it possible to obtain a sufficient controlling characteristic with the F/V (Frequency-Voltage) conversion method of mono-stable type. The difference from TA7713P is that the stop function is automated in TA7713P, however, it is operated by the external signal in TA7712P.

Description is made on the application of TA7713P in the following.

Operation of FG Output (11/13 pin) and TFG (12/14 pin)

In Fig. 1, Q1 and Q2 are the monostable multi-vibrator to which gate (Q2 base) the signal from each position sensing input of Ha, Hb and Hc is input after ORed and shaped in waveform by FF.

The pulse width of MMV made by Q1 and Q2 is determined by R2 and C2 to be connected to TFG (12/14 pin), and the square wave having the pulse width to be determined by C2 and R2 is output.

Of course, this frequency is proportional to the rotation signal and this frequency is six times the frequency of each position sensing. (6 per 1 electrical rotation)

F/V conversion operation is made through connecting FGQ output to LPF for intergration. However, if R2 is made variable, the conversion gain can be controlled.

- . Measure V_{FGL} and τ_{FG} when SW2 is set at a.

TIME CHART FOR NORMAL ROTATION
CLOCK 360Hz

APPLICATION OF TA7713P

Like a video disk player, TA7713P is provided with the stopping function which, in a short time, stops the motor having a large inertia, and makes the quick disk-change possible.

To make the frequency generator (FG) unnecessary which was formerly required for fetching the rotation signal, the signal from the position sensing input is ORed and is output to FG output pin (11 pin).

Therefore, for FG output, three position sensing outputs (Hz,Hb,Hc) are ORed, and the rotation speed signal of the frequency of six times that of one output can be fetched resulting in making it possible to obtain a sufficient controlling characteristic with the F/V (frequency-voltage) conversion method of monostable type.

Description is made on the application of TA7713P in the following.

(1) Operation of FG Output (11 pin) and TFG (12 pin)

In Fig.1, Q1 and Q2 are the monostable multivibrator to which gate (Q2 base) the signal from each position signal input of Ha, Hb and Hc is input after ORed and shaped in waveform by FF.

The pulse width of MMV made by Q1 and Q2 is determined by R2 and C2 to be connected to TFG (12 pin) and the square wave having the pulse width to be determined by C2 and R2 is output. Of course, this frequency is proportional to the rotation speed signal and this frequency is six times the frequency of each position sensing. (6 per 1 electrical rotation.)

F/V conversion operation is made through connecting this FG0 output to LPF for integration. And if R2 is made variable, the conversion gain can be changed.

(2) Stopping Function

For stopping the motor, it is the simplest way to stop the inertia through the friction after turning off the motor driving power supply.

However, since too much time is required for stopping the motor having a large inertia, this method is not suitable to the video disk or audio disk player which requires the disk changed in a short time.

In this case, the motor is changed over to the reverse torque state at the same with the input of the stop signal, and the brake is applied keeping the state of normal rotation with reverse torque as an usual method.

In this method, however, reverse runaway is liable to occur unless the reduction of rotation is detected through a certain measure to stop the reverse torque state at an appropriate time.

(For example, PLL motor controller TC9142P is provided with the circuit by which the reverse rotation signal is output at the same time with the stop signal input, and the reduction of rotation speed in this reverse torque state is detected by FG signal to disconnect the reverse rotation signal when the rotation speed reduced down to $\frac{1}{8}$ the initial speed.)

In case of the motor of high rotation speed and large inertia like the motor for video disk, to perform the quick braking operation, it is necessary to keep this condition of the forward rotation with reverse torque until just before the motor stops in order to reduce the inertia stopping time to the minimum through the friction force.

For this purpose, in TA7713P, the state of forward rotation with reverse torque is kept continued until the motor stops and either of three position sensing signals detects the reverse rotation with the built-in reverse sensing circuit. (In case of application of TA7713P, there is no problem in the optical system, however, it is of course necessary to put the sensor apart from the disk at the same time with the stop signal input or before the reverse rotation start in VHD CED system.)

At this time, the state of the reverse rotation is max. 60° in electrical angle. Furthermore, in order to remove the inertia due to this reverse rotation, the inside monostable multi-vibrator generates the time normal torque determined by the state of C2, R2 and 10 pin to turn out the inertia-stopped state afterwards. By means of these functions, the motor can be stopped in 5~8 seconds with the optical system of high rotation speed and in 2~3 seconds with VHD CED system.

Fig. 2 EACH CONTROL INPUT

Fig. 3 PROCEDURE FOR STOP/START

Stop Sequence (Procedure for stopping the system in normal rotation)

1. Set CW/CCW input pin (9 pin) to "H" to make the clockwise mode with reverse torque state. ((A) point)
2. Detect the reduction of rotation speed due to the reverse torque with FG, etc, and when rotation speed is reduced to $1/3 \sim 1/8$ normal one, set START/STOP input pin (8 pin) to "H". ((B) point)
3. By this procedure, the motor stops automatically.

For starting the system, it is enough to set both START/STOP input and CW/CCW input to "L". ((C) point)

Fig. 4 ENLARGED VIEW OF REVERSE SENSING

Fig. 5 TIMING IN CASE τ_1 (or τ_3) IS LONGER THAN FORWARD ROTATION SENSING TIME

(3) Position Sensing Input Circuit

The common mode voltage range of (14), (15), (16), (17), (18) and (19) pins in position sensing input circuit is 2V to $V_{CC}-0.5V$. Therefore, in case of $V_{CC}=5V$, the range is 2~4.5V.

Hysteresis of 7mV(TYP.) is provided at the input to make the operation accurate. Take care not to allow the hall output exceed the max. voltage 400mV of the position sensing input as shown in maximum rating for caution.

(4) Output Circuit

As shown in the block diagram, in the output circuit, the Darlington emitters of PNP and NPN are of open type on the upper side, and the lower side NPN is the open collector type.

Connect the external transistor in the same manner as that of the application circuit.

TA7713P

BASIC APPLICATION CIRCUIT

TA7715P

FREQUENCY TO VOLTAGE CONVERTER

The TA7715P is a general purpose F-V converter designed for FDD, VTR, ATR and player F-servo system use.

It contains High Gain Input Amplifier, Hysteresis Amplifier (for wave form shaping), and Sample-and-Hold type F-V conversion amplifier.

FUNCTION

(A) $V_{13}=1.0V$

Initial → MODE1 → MODE2 → MODE3 → MODE4 → MODE5 → MODE6

	SW	SU	SV	SW	SU	SV	SW
WL	L	L	H	H	H	H	L
VL	H	H	L	L	H	H	H
UL	H	H	H	H	L	L	H

(B) $V_{13}=GND$

Initial → MODE1 → MODE2 → MODE3 → MODE4 → MODE5 → MODE6

	SW	SV	SU	SW	SV	SU	SW
WL	L	L	H	H	H	H	L
VL	H	H	H	H	L	L	H
UL	H	H	L	L	H	H	H

TEST CONDITIONS

- . Use measuring circuit 3 and $V_{CL}=1.5V$.
- . All switches must be operated momentarily shorted to GND ("L" Level).
- . Initializing is obtained with SW "ON" and SCL ON.
- . Power switch SV_{CC} and SCL must be held "ON" state until the end of measuring.

INTERNAL CIRCUIT

(1) Output Driver/Switching Regulator

(2) CW/CCW Control Input

(3) Stand-By Control Input

(4) Control Amplifier

(5) Shut Down Terminal

Pin ⑨ is shut down input for system reset.

Thermal and over voltage shut down are available by using this terminal.

APPLICATION CIRCUIT 1.

(Output Current Boost Application with Feed Back (R_1))

Note : Switching characteristics are required with D_1 and Q_1 for higher efficiency.

APPLICATION CIRCUIT 2.

APPLICATION CIRCUIT 3.

(Output Current Boost Application with No-Local Feed Back)

Note: •Switching characteristics are required with D₁ and Q₁ for higher efficiency.
 •This application has no local feed back loop by R₁ (Shown in application circuit 1).

TA7736F/P

DC MOTOR DRIVER IC.

The TA7736P is a 3-phase Bi-directional motor driver IC.

It designed for use VCR, tape deck, floppy disk and record player motor drivers.

It contains output power drivers, position sensing circuits, control amplifier and CW/CCW control circuit.

- . 3-Phase Bi-Directional Driver and Output Current Up to 1.0A.
- . Few External Parts Required.
- . Wide Operating Supply Voltage Range
: $V_{CC(opr)}(Min.)=7V$
- . Forward and Reverse Rotation is Controlled Simply by Means of a CW/CCW Control Signal Fed Into 16 PIN.
- . High Sensitivity of Position Sensing Amplifier.
($V_H=10mV(Typ.)$, Recommend to Use TOSHIBA Ga-As Hall Sensor "THS" Series.)
- . Surge Protect Diode Connected for All Input Terminals.
(Position Sensing, Control, CW/CCW Control Inputs.)

Weight:

DIP16-P-300A: 1.0g (Typ.)
HSOP16-P-300: 0.5g (Typ.)

APPLICATION CIRCUIT 1

(BASIC APPLICATION CIRCUIT)

APPLICATION CIRCUIT 2

(TC9142P + TA7736P $3\frac{1}{2}$ PLL FDD)

Note 1. R_f is a feed back Resistor that's voltage drop is equal to Input Voltage ($V_2 - V_1$) in this application with feed back by Zener Diode.

Note 2. Required X'tal frequency is calculated by following

$$f_x = (no \cdot a / 60) \cdot 128 \cdot 20 \quad N = 42.6 \quad no \cdot a \cdot N$$

(at PIN 10 "High" state)

$$f_x = (no \cdot a / 60) \cdot 128 \cdot 27 \quad N = 57.6 \quad no \cdot a \cdot N$$

(at PIN 10 "Low" state)

Where no = Required Rotation Speed (rpm)

a = Number of FG pulse (pulse/rotation)

N = Count Down Ratio (4.32 or 128)

PIN 4	PIN 5	N
H	H	32
L	H	128
H	L	4

Note 3. Recommended value of R_A and R_B is 50k Ω to 300k Ω

The combination ratio of F/V and P/V output is designed by changing these value. For example, if you want more F/V conversion gain compare to P/V's one for fast system initial start up. Use a higher value of R_B compare to R_A .

Note 4. TC9142P's FG Amplifier gain is 30dB (Typ.) and required input signal is over 30mVrms.

If the FG doesn't output over this value.

Required a Front Amplifier.

APPLICATION CIRCUIT 3

(TC9142P + TA7736P $3\frac{1}{2}$ PLL WDD)

APPLICATION CIRCUIT

$R_K=0.25 \cdot R_m$

$R_T = \frac{E_a}{5 \cdot I_{ref}}$

Note:

R_m =D/C Resistance of motor

E_a =Counter-electromotive force

APPLICATION

Equivalent circuit of Motor is described by serial connection with equivalent DC resistance R_m (usually Motor coil DC resistance) and voltage source E_a (counter-electromotive force) which is proportional to motor rotation, as shown in Fig.1.

When V1-2, the voltage between ① and ② pins of TA7768F is set,

$$V1-2 = R_K \cdot I_m + R_m \cdot I_m + E_a \dots\dots\dots (1)$$

Input balancing condition of the comparator

$$R_K \cdot I_m + R_T \cdot I_{ref} = V1-2 \cdot \frac{R1}{R1+R2} \dots\dots\dots (2)$$

From (1) and (2)

$$k \cdot (R_K \cdot I_m + R_m \cdot I_m + E_a) = R_K \cdot I_m + R_T \cdot I_{ref}$$

$$k = \frac{R1}{R1+R2} = \frac{1}{1+4} = 0.2$$

$$k(R_K + R_m) = R_K \dots\dots\dots (3)$$

$$R_T \cdot I_{ref} = k \cdot E_a$$

$$E_a = 5 \cdot R_T \cdot I_{ref} \dots\dots\dots (4)$$

For TA7768F application, R_K should be firstly fixed considering Motor DC resistance R_m by using the formula (3).

Then counter-electromotive force E_a at necessary rotation is calculated by E_a -rotation characteristics. And R_T is finally given through the formula (4).

Fig. 1

TA7774F/P

STEPPING MOTOR DRIVER IC

TA7774P/F is 2-phase Bipolar stepping motor driver IC designed especially for 3.5 or 5.25 inches FDD head actuator drives.

It consists of TTL compatible input circuit, dual bridge driver outputs with flyback diodes, changing circuit of motor coil drive voltage (Power saving circuit) and stand-by circuit.

- . One Chip 2-Phase Bipolar Stepping Motor Driver.
- . Power Saving and Stand-by Operation are available.

I stand-by (I_{CC3}) $\leq 115\mu A$

- . Build-in Punch Through Current Restriction Circuit for System Reliability and Noise Suppression.
- . TTL Compatible Inputs
- . Surface Mount is available with F Type.
- . Output Current up to 0.4A (peak)

TA8102P

POWER DRIVE IN FOR DC PLAYER

TA8102P is a power driver IC designed for controlling the focus actuator coil of pickup, tracking actuator coil, disk motor and feed motor in CD player. This is the most suitable for the power driver of the general-purpose motor.

- Two operation amplifiers with bootstrap terminals are incorporated.
- BTL Application also available.
(BTL Application is realized with single 5V power supply)
- High output current : $I_{O(\text{peak})}=1\text{A}$
- High input impedance is realized by built-in buffer amplifier.
- Built-in thermal shut down.

DIP16-P-300A

Weight : 1.11g (Typ.)

MAXIMUM RATINGS ($T_a=25^\circ\text{C}$)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Power Supply Voltage	V_{CC}	15	V
Output Current	$I_{O(\text{peak})}$	1	A
Power Dissipation	P_D	1.4*	W
Operating Temperature	T_{opr}	$-25\sim 75$	$^\circ\text{C}$
Storage Temperature	T_{stg}	$-55\sim 150$	$^\circ\text{C}$

* Derated above $T_a=25^\circ\text{C}$ in the proportion of $2\text{mW}/^\circ\text{C}$.

Note. Output protection circuit is not incorporated.

Care should be taken not to short between

FUNCTION DESCRIPTION OF EACH TERMINAL

PIN No.	SYMBOL	I/O	FUNCTION	REMARKS
1	VEE	-	Negative power supply terminal.	Connect to pins 4,5,8,12 and 13
2	IN1	I	Power amp.-1 Control signal input terminal.	 Buffer amp.
3	VREF	-	Reference voltage source terminal.	
4	VEE	-	Negative power supply voltage terminal.	Connect to pins 1 and 8.
5	VEE	-	Negative power supply voltage terminal.	
6	INC	I	Power amp.-1 and 2 common control signal input terminal.	
7	IN2	I	Power amp.-2 control signal input terminal.	 Buffer amp.
8	VEE	-	Negative power supply voltage terminal.	Connect to pins 1, 4 and 5.
9	OUT2	O	Power amp.-2 output terminal. Error signal amp. output of IN2 and INC.	
10	VCC	-	Positive power supply voltage terminal.	Connect to 15 pin
11	BS2	-	Bootstrap terminal -2.	
12	VEE	-	Negative power supply voltage terminal.	
13	VEE	-	Negative power supply voltage terminal.	
14	BS1	-	Bootstrap terminal -1.	
15	VCC	-	Positive power supply voltage terminal.	Connect to 10 pin
16	OUT1	O	Power amp.-1 output terminal. Error signal amp. output of IN2 and INC.	

Note: Outside IC, connect to { VCC terminal (10,15 pins)
VEE terminal (1,4,5,8,12,13 pins)

APPLICATION CIRCUIT EXAMPLE-1

(SINGLE POWER SUPPLY BTL AMP.)

- Through connecting resistance to V_{REF} terminal, reference electric potential can be freely set.
- Gain is $G_v=15.5\text{dB}$ fixed.

APPLICATION CIRCUIT EXAMPLE-2

(DOUBLE 2-CHANNEL AMP.)

- Take precautions for the polarity of the operating load of the power-amp.-1 as a non-inverting amplifier and of the power-amp.-2 as a inverting amplifier.
- Gain is fixed at $G_v=9.5\text{dB}$.

TA8212F

◦ QUAD POWER OPERATIONAL AMPLIFIER

TA8212F is Quad Power Operational Amplifier designed especially for Tracking and Focus Actuator drives and Spindle and Carriage Motor controls for CD Players and also applicable to any other Motor Drive and Power Drive Applications.

◦ Features

- Thermal Shut Down Circuit insided.
- Buffer Amplifiers for High Input Impedance Feature.
- PFP20 Surface Mountable Power Package Sealded.

Weight: 0.79g (Typ.)

MAXIMUM RATINGS (Ta=25°C)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	$V_{CC}-V_{EE}$	14.5	V
Output Current	I_O (PEAK)	700	mA
Power Dissipation	P_D	1.0	W

Note 3: 9 and 19 PINs are required to connect.

ALLOWABLE POWER DISSIPATION

APPLICATION CIRCUIT

Closed Loop Gain of G_v is fixed approximating 9.5dB by internal circuit.

TA8400P

DUAL BRIDGE DRIVER

TA8400P is Dual Bridge Driver designed especially for VCR cassette and tape loading motor drives.

- 4 Modes Available (CW/CCW/STOP/BRAKE)
- Output Current Up to 0.4A (AVE) and 1.0A (PEAK)
- Wide Range of Operating Voltage
 - $V_{CC\text{ opr}}=4.5\sim 18V$
 - $V_S\text{ opr}=0\sim 22V$
 - $V_{\text{ref opr}}=0\sim 22V$
- Built-in Thermal Shutdown, Over Current Protector and Punch-Through Current Restriction Circuit.
- Hysteresis for All Inputs.

Weight: 1.11g (Typ.)

APPLICATION CIRCUIT

TA8401F

FUNCTIONAL BRIDGE DRIVER

- Wide operating Supply Voltage Range : $V_{CC(opr)}=3\sim 15V$
- Capsuled in Flat Package 16 pin.
- Forward and Reverse Rotation, Short Breke Modes are available by means of Rotation Control Signals.
- High Efficiency is obtained.
- Can be used as Interface Driver.

$V_{CS} - T_a$

TA8405S

DUAL BRIDGE DRIVER

TA8405S is Dual Bridge Driver designed especially for VCR cassette and tape loading motor drives.

- 4 Modes Available (CW/CCW/STOP/BRAKE)
- Output Current Up to 0.4A (AVE) and 1.0A (PEAK)
- Wide Range of Operating Voltage

$$V_{CC \text{ opr}} = 4.5 \sim 22V$$

$$V_S \text{ opr} = 0 \sim 22V$$

- Built-in Thermal Shutdown, Over Current Protector and Punch-Through Current Restriction Circuit.
- Hysteresis for All Inputs.

Weight: 0.92g (Typ.)

MAXIMUM RATINGS (Ta=25°C)

H	H or L	L	Brake Mode, La ⁺ ~Lc ⁺ ;ON
L	H or L	H or L	Stop Mode, All Output;OFF

D1~D3 are input protect diodes.

Input current of START/STOP and CW/CCW are calculated by following equations.

$$I_{IN\ C} = \frac{V_{CC} - V(9/11) - V_{BEQ3} - V_{BEQ4} - V_{BEQ5}}{R_4} \doteq \frac{V_{CC} - V(9/11) - 2.1}{26 \times 10^3}$$

(9/11 pin)

$$I_{IN R} = \frac{V_{CC} - V_8 - V_{BEQ6} - V_{BEQ7} - V_{BEQ8}}{R_6} \doteq \frac{V_{CC} - V_8 - 2.1}{26 \times 10^3}$$

(8 pin)

And also input current of BRAKE (10/12pin) is calculated by following equation.

$$I_{IN\ B} = \frac{V(10/12) - V_{BEQ2} - V_{BEQ3}}{R_2} \div \frac{V(10/12) - 1.4}{26 \times 10^3}$$

(10/12 pin)

(2) FG Output Circuit

TA8412P/TA8412F

3 pulses a rotation of FG pulse are generated by the circuit.

FG output transistors of Q12 and Q13 work push-pull.

Specified output voltage generates if load resistor connect to FG output to VCC.

TA8413P

3-PHASE BI-DIRECTIONAL HALL MOTOR CONTROL IC

- FG is not required. (System for obtaining rotation signal through position sensing)
- Start/stop, CW/CCW and brake function is provided.
- Gain of position sensing circuit is high, and hysteresis is provided.
- Rotation signal output is provided. (Frequency signal of three times the position sensing output (hall element output) can be obtained.)
- External transistor type.

MAXIMUM RATINGS ($T_a=25^\circ\text{C}$)

BLOCK DIAGRAM

Operation of Automatic Self Recovery Circuit

If Motor Rotation is disturbed by external force or obstacles.

Over Current, which have a possibility of Drive Coil Burning is generated by decreasing of Back Electro Motive Force (BEMF).

Therefore, Over Heat Protection of Drive Coil is required to Fan Motor Drive System. Generally, Series Connection of Temperature Dependence Elements (Posistor) to Output Drive Coil or to use drive IC incorporates protection circuit are required to get coil burning protection.

Posistor is so expensive, therefore, IC's incorporate this function are coming into wider use to Fan Motor Drive in recent years.

Generally, Re-switch operation after the turn on of protection circuit is required for system start up again because the circuit is constructed by flip-flop circuits.

But there's no use re-switch operation with TA8414P/F because of build-in automatic self recovery circuit.

Fig. 1 shows ⑥ pin voltage and the operation of this functions are follows.

1. Normal Rotation States

Internally generated charging current of ISL ($7\mu\text{A}$ TYP.) charge-ups external capacitance of CL connected to PIN ⑥.

But FG pulse, generates among in rotation states and the frequency is proportional to rotation speed, discharges CL charge periodically.

Therefore, Voltage of PIN ⑥ is becoming sawteeth waveform and will not to reach V_{SC} of limiting voltage (1.3V TYP.).

2. Motor Lock States

If a Motor is locked by external force or obstacles, FG pulse generation is stopped. As a result, the voltage of PIN ⑥ increase.

Torque generation is stopped after when the voltage of PIN ⑥ reaches to V_{SC} . Further more, voltage of PIN ⑥ is increased by charging current of ISL and then reaches to V_{SCR} of self recovery voltage (2.8V TYP.)

And then, Rotation Torque is generated momentary and voltage of PIN ⑥ is decreased to V_{SC} level during this time interval by discharging of CL.

During the period of Motor lock, the voltage of PIN ⑥ goes between V_{SCR} and V_{SC} and generates momentary torque periodically at the points of V_{SC} .

3. After Release of Motor Lock

Momentary torque will be able to rotate the motor and will generate FG pulse momentary if the motor lock is released.

Fig. 1 Operation of Automatic Self Recovery Circuit

OUTPUT CIRCUIT

Fig. 2 shows Output Circuit

Fig. 2 Output Circuit

INPUT CIRCUIT

Hall sensor Input circuit is shown in Fig.3. High Sensitivity and PNP differential amplifier with build-in hysteresis circuit have wide common Range and high noise elimination characteristics.

Fig. 3 Input Circuit

APPLICATION CIRCUIT 1 2 Phase Unipolar Fan Motor Drive Circuit

Note 3. R_A and R_B are determined by Output Current and h_{fe} of Power Transistor as follows.

$$\frac{V_{CC}-1.7}{R_A \text{ (or } R_B)} \geq FOD \cdot \frac{I_O \text{ MAX}}{h_{fe}}$$

FOD : Over Drive

Factor ≥ 2

APPLICATION CIRCUIT 2 1 Phase Bipolar Fan Motor Drive Circuit

Note 4. R_A , R_B , R_C and R_D are determined by Output Current and h_{fe} of Power Transistors as follows.

• R_A and R_B are the same way to Application Circuit 1

$$\frac{V_{CC}-V_{BE}-V_{CE}(\text{SAT})}{R_D \text{ (or } R_C)} \geq FOD \cdot \frac{I_O \text{ MAX}}{h_{fe}(u)}$$

$$\frac{V_{CC}-1.0}{R_D \text{ (or } R_C)} \geq FOD \cdot \frac{I_O \text{ MAX}}{h_{fe}(L)}$$

TOSHIBA Surface Mountable Transistor Series are recommended to these applications.

TA8415P

STEPPING MOTOR CONTROLLER/DRIVER

TA8415P is general purpose unipolar stepping motor controller/driver, applicable to 3/4 phase motors and 1, 1-2, 2 phase excitation drive by initial setting of control terminals.

- . 1 chip stepping motor controller/driver.
- . 3 or 4 phase and 1, 1-2, 2 phase excitation drive are available.
- . CW/CCW rotation and 1 clock or 2 clock drive are available.
- . Hysteresis is provided with clock, CW/CCW, reset inputs for noise protection.
- . Output enable, initial detect are available.
- . Output current up to 0.4A.

Weight: 1.1lg (Typ.)

4 phase motor 1-2 phase excitation drive I.

APPLICATION CIRCUIT 4

4 phase motor 1-2 phase excitation drive II.

TA8416F

LOW VOLTAGE USE 3 PHASE HALL MOTOR DRIVER

TA8416F is low voltage use 3 phase Hall Motor Driver IC with stand-by function designed especially for portable VCR, Head Phone Stereo and other battery operated electrical equipment motor drive applications.

- . 3 phase bipolar/unipolar Hall Motor Driver
- . Low voltage use
- . Voltage drive type
- . Stand-by function for longer battery life
- . MFP16 Flat package sealed
- . 2 Hall Sensor drive available
- . Operating supply voltage : $V_{CC}=1.8\sim 7.2V$
 $V_S=0.2\sim 7.2V$
- . Output current : $I_O \text{ MAX} = 0.7A \text{ (AVE)}$
 $= 1.3A \text{ (PEAK)}$
- . Built-in thermal shut down circuit

TERMINAL DESCRIPTION

1. Rotation Direction Control Input (FR Input, ⑦ Pin)

Motor rotation direction is controlled by this terminal. More than 1V of control voltage becomes motor forward rotation and less than 0.4V of this voltage becomes motor reverse rotation.

22kΩ of input resistance is equipped in series of this terminal. Therefore input current is calculated by following equation.

$$I_{IN(FR)} = \frac{V_7 - V_{BE}}{22 \times 10^3} = \frac{3 - 0.7}{22 \times 10^3} \div 100 \mu A$$

(V7=3V)

And the open mode of the terminal, there's no input current flow.

2. Start/Stand-by Control Input (RS Input, ⑧ Pin)

Start (Run) and stand-by modes are controlled by this terminal.

Operating voltage are more than 1V (Start or Run) and less than 0.5V (Stand-by).

Supply current becomes less than 100μA in Stand-by mode.

3. Hall Sensor Inputs ($H_a^{+,-}$, $H_b^{+,-}$, $H_c^{+,-}$, ①, ②, ③, ④, ⑤, ⑥ Pin)

Hall Sensor Inputs for position sensing

2 Hall Sensor Drive is also available by 4 pcs of $10k\Omega$ matrix resistors connect to $H_a^{+,-}$ and $H_b^{+,-}$ terminals.

But, in case of lower speed application, poor precision sensor positioning and good torque ripple and W/F characteristics required.

We recommend to use 3 Hall Sensors for stable operations. Input sensitivity is 20mV (TYP), but actual value is 2~3mV.

We recommend to input more than 20mV to get good W/F characteristics.

Wide DC operating range of $0 \sim V_{CC} - 1.2V$ is accomplished by PNP input circuit and also built in hysteresis restricts mis-function caused by external noise.

But care should be taken not to have a common impedance between Hall Sensor GND lines and the power GND line for stable operations.

To decrease noise problems, we recommend to connect noise suppression capacitance ($0.0001 \sim 0.02 \mu\text{F}$) between each Hall Input Terminal.

4. Output Terminals (L_a , L_b , L_c , ⑩, ⑫, ⑬ Pin)

This IC is designed for use 3 phase unipolar drive applications, but Bipolar drives also available with additional 3 transistors.

Care should be taken with back electro motive force generated by coil not to over the specified voltage.

5. Pre-Drive Stage (l_a , l_b , l_c , ⑯, ⑮, ⑭ Pin)

Open collector type Pre-drive stage required current are calculated by following requation.

$$I(l_a) = K_o \cdot \frac{I_o}{h_{fe}}$$

$$K_o \geq 2$$

h_{fe} : h_{fe} of PNP transistor

I_o : Output current

$$I(l_a) = \frac{V_S - V_{BE(PNP)} - V_{SU}}{R}$$

Summing that, $V_{BE(PNP)}=0.7V$, $V_{SU}=0.2V$

$$R = \frac{h_{fe}(V_S - 0.9)}{K_o \cdot I_o}$$

For Example, $V_S=3V$, $h_{fe}=100$, $I_o=0.7A$, $K_o=2$

$$R=150\Omega$$

1. 3-Phase Full Wave Application

(Note) . VS and VCC terminals connecting application also available.

. We recommend to use TOSHIBA Ga-As type Hall Sensor THS100 series.

. Output capacitans ($4.7\mu\text{F} \times 3$) are for noise suppression use.

It is required to increase the value if the vibration noise is so loud.

2. 3-Phase Half Wave Application

- (Note) . Other circuit and configurations are all the same to APPLICATION CIRCUIT 1.
- . Care should be taken with BEMF value generated by coils that not increase specified value of output transistor withstand voltage.

TA8420AF/21AF

1 CHIP DC FAN MOTOR DRIVER

- . Built-in lock sensing circuit (Over heat protector for driver coil).
- . Built-in automatic self rotation recovery circuit after release of motor locking.
- . Operating voltage : $V_{CC\text{ opr}}=4\sim 15V$
- . Output current : $I_O\text{ MAX(AVE)}=1.0A$
- . Thermal shutdown circuit incorporated.
- . Suitable for super micro fan motor.
- . Surface mountable MFP 10 package sealed.
- . Less external component.
- . TA8420AF has FG(Frequency generator) out for rotation speed sense and TA8421AF has RD (Rotation detect) out for rotate or stop sense.

Weight : 0.1g(Typ.)

OPERATION OF AUTOMATIC SELF RECOVERY CIRCUIT

If Motor Rotation is disturbed by external force or obstacles.

Over Current, which have a possibility of Drive Coil Burning, is generated by decreasing of Back Electro Motive Force (BEMF).

Therefore, Over Heat Protection of Drive Coil is required for Fan Motor Driver System. Generally, Series Connection of Temperature Dependence Elements (Posistor) to Output Drive Coil or to use drive IC incorporates protection circuit are required to get coil burning protection.

Posistor is so expensive, therefore, IC's incorporate this function are coming into wider use for Fan Motor Drive in recent years.

Generally, re-switch operation after the turn on of protection circuit is required for system start up again because the circuit is constructed by flip-flop circuits. But there's no use re-switch operation with TA8420AF, TA8421AF because of built-in automatic self recovery circuit.

Fig.1 shows ⑩ pin voltage and the operation of this functions are as follows.

1. Normal Rotation States

Internally generated charging current of ISL (0.25 μ A TYP.) charge-ups external capacitance of C_{SC} connected to PIN ⑩ .

But FG pulse, generates among in rotation states and the frequency is proportional to rotation speed, discharges CL charge periodically.

Therefore, voltage of PIN ⑩ is becoming sawteeth waveform and will not to reach V_{SC} of limitting voltage (1.3V TYP.).

2. Motor Lock States

If a Motor is locked by external force or obstacles, internal FG pulse generation is stopped. As a result, the voltage of PIN ⑩ increase.

Torque generation is stopped after when the voltage of PIN ⑩ reaches to V_{SC}

Further more, voltage of PIN ⑩ is increased by charging current of ISL toward the V_{SCR} of self recovery voltage (2.9V TYP.).

And then the PIN ⑩ voltage reaches to V_{SCR}.

Automatic self recovery circuit operates and generates a momentary torque

(t_{ON}=200ms TYP.). But Motor can not start own rotation if the Motor is still locked by external force or obstacles.

In this period, voltage wave form of PIN ⑩ is becoming sawteeth that peak is V_{SCR} and Botom is Minimum DC level of approximately 0.7V.

3. After Release of Motor Lock

PIN ⑩ voltage can not reaches V_{SC} level after release of Motor lock because of discharging operation of C_{SC} .

Fig. 1 Automatic Self Rotation Recovery Circuit Operation

○ FG output (TA8420AF) and RD output (TA8421AF)

FG output terminal of PIN ⑩ of TA8420AF outputs a rotation speed proportional FG signals with open collector mode.

This FG signal duty and mode are all the same to output A (PIN ②).

RD output terminal of PIN ⑩ of TA8421AF outputs a state signals (Rotate or Stop).

RD output becomes low (Actually $V_{SAT}(RD)$ level of 0.3V TYP.) when the Motor in rotation state and generates t_{off} pulse when the rotation is locked (Refer to Fig. 1).

APPLICATION NOTE

○ Hall Input Terminals (PIN ⑧, ⑨)

Operating DC Level of Hall Inputs (PIN ⑧, ⑨) are $2.5 \sim V_{CC} - 0.8V$ as specified.

If the voltage appeared at Hall Sensor output terminal within this range, there's no requirment of external connecting level shifting resistor.

But R_a , (or R_a and R_b) is required to connect series with Hall sensor if this is not.

R_D : Dynamic Resistance of Hall Sensor.

Fig. 2

$$2.5(V) \leq V_{CC} \cdot \frac{R_b + \frac{R_d}{2}}{R_a + R_b + R_d} \leq V_{CC} - 0.8(V)$$

- We recommend to connect noise suppression use capacitance between IN A and IN B for stable operation.

○ Recommended Operating Conditions

- TA8420AF, TA8421AF are designed for 5, 12V operating voltage use.
- Please refer to Fig.3 of Recommendation Operating Region.

Fig. 3 Recommendation Operating Region

○ Transient Thermal Resistance

Fig. 4 Transient Thermal Resistance (Single Pulse Condition)

QUIESCENT CURRENT - V_{CC}

OUTPUT SATURATION - I_O

TA8420AF/21AF

APPLICATION CIRCUIT

- Note 1. There's no requirement of this diodes in normal applications
But if the V_{CC} is more than 14V or use large value of coil reactance,
we recommend to connect this diodes.
- Note 2. There's no requirement of this capacitance in normal applications.
But connection $0.47 \sim 10 \mu F$ of this capacitance increases a stability of
operation.
- Note 3. This capacitance is for noise suppression use.
Connect if required.
- Note 4. We recommend to connect capacitance between each output and GND (or out (A)
and (B)), to suppress RFI and noise problems.
- Note 5. In case of large mutual inductive value between L_a and L_b .
Diodes (or CR) are required to restrict parasitic oscillation caused by
negative electro-motive force generated by inductive mutual effect between
 L_a and L_b .

TA8422F

(TENTATIVE)

- LOW VOLTAGE, LOW NOISE 2 PHASE UNIPOLAR HALL MOTOR DRIVER

TA8422F is low voltage and low noise use Hall Motor Driver IC designed especially for Fan and Head Phone Stereo Motors.

Features

- Speed Control is available with external Resistor.
- Low Voltage use: $V_{CC\text{ opr}}=1.2\sim 8.0V(T_a=-30\sim 75^{\circ}C)$
- Low Noise Drive
- Higher Output Current: $I_O\text{ MAX(AVE)}=500mA$
 $I_O\text{ MAX(PEAK)}=700mA$
- Few external parts required
- Thermal Shut Down Circuit provided.

Weight: 0.09g (Typ.)

MAXIMUM RATINGS ($T_a=25^{\circ}C$)

CHARACTERISTIC	SYMBOL	RATING	UNIT

TERMINAL DESCRIPTIONS

PIN NO.	SYMBOL	FUNCTION
①	S-GND	Signal GND Care should be taken not to have a common impedance with P-GND (③ PIN) line for stable operations.
②, ④	La, Lb	Output La, Output Lb Open Collector type Outputs
③	P-GND	Power GND Care should be taken not to affect any influences to other circuits especially for ① PIN caused by large output current flow through this terminal.
⑤	V _{CC2}	Power Supply(Drive) Connect Bypass Capacitance if required.
⑥	SC	Speed Control Parallel connection of 0.1 μ F and 5~15k Ω is required for speed control. This time constant controls Motor Speed. Higher value of Resistor sets the Motor Speed low and Lower sets high. Temperature Dependant Resistor compensates temperature characteristics of Motor Speed. Rotation speed vs V _{CC} characteristics is improved by using large value of this capacitance. But this results bad ripple rejection characteristics. So we recommend to select optimum value of the capacitance. Connect this PIN to GND if the Motor required no speed control feature.
⑦	PC	Phase Compensation Connect 0.1 μ F~2.2 μ F capacitance for frequency compensation. But if the Motor required no speed control feature there's no requirement (open) of this capacitance.
⑧ ⑨	Ha ⁺ , Ha ⁻	Sensor Inputs Recommend to input less than 100mVp-p of Hall Sensor Output Voltage to keep low noise characteristics of this IC. We recommend to use TOSHIBA GaAs Hall Sensor THS1000 Series.

APPLICATION CIRCUIT 1 (Speed Control Application)

NOTE 1: Connect if required

APPLICATION CIRCUIT 2 (Free Running Application)

NOTE 1: Connect if required

NOTE 2: D1 and D2 are required to connect if the BEMF generated by Output Coils over the specified Output Break down voltage ($V_o=10V$).

TA8423F/P

3 PHASE Bi-DIRECTIONAL HALL MOTOR DRIVER

The TA8423P/F are 3 phase Bi-Directional Hall Motor Driver IC designed for VCR (Capstan, head and reel), ADP, Tape Deck, FDD and other Output Driver for 3 phase bipolar Hall motors.

- . Few external parts required
- . Wide operating supply voltage range
: $V_{CC(opr)}=7\sim 17V$
- . Forward rotation, reverse rotation and stop are controlled by 1 terminal signal control and easy to interface with CPU.
- . High sensitivity of the position sensing circuit.
(Hall sensor input) : $V_H=20mV(Typ.)$
- . Large output current : $I_O MAX=1.2A (AVE)$
- . Protect diodes equipped for all inputs
- . Recommend to use TOSHIBA Ga-As Hall sensor "THS100 series"
- . Built-in internal reference
- . Built-in thermal shut down circuit

TEST CIRCUIT 1

TEST CIRCUIT 2

TA8423P/TA8423F

TEST CIRCUIT 3

1. CONTROL INPUT CIRCUIT

$V_{RF}(=R_F \cdot I_L)$ of feed back voltage is feed backed to negative input of control amp internally.

Voltage gain becomes approximately equal to 1 (0dB) by this internal feed back.

(Note) 2 terminals (3), (13) Pins for F version and (3), (14) Pins for P version) are provided for R_F terminal to decrease the interference caused by internal common impedance.

Both Pins are required to connect for stable operation.

INPUT - OUTPUT CHARACTERISTIC

R_L : Output Coil Resistance
 $V_{CE(SAT)}$: Output Saturation Voltage
 (Upper and Lower Side Total).

V_{RF} is feed back voltage generated by R_F and output current of I_L , drive current of I_D and internal reference circuit current of I_R .

But I_O and I_R are negligible therefore,

$$I_R \ll I_L + I_D$$

$$V_{RF} \div R_F (I_L + I_O + I_R)$$

$$I_L \gg I_D, I_R$$

$$V_{RF} \div I_L \cdot R_F$$

0 Torque state is obtained when less than 2.3V of control voltage fed into input terminal.

0 Torque state also obtained by select a stop mode by controlling FRS input ((4)Pin).

Less supply current is obtained with this condition.

2. FRS CIRCUIT

Forward, Reverse and Stop Modes are selectable by controlling this terminal. Specified voltages are less than 1.3V (Forward), 2.4~3.0V or Open (Stop) and 3.9V~ V_{CC} (Reverse).

V_{FRS} - I_{FRS} characteristic is shown below.

FUNCTION

FRS Input (4 Pin)	Position Sensing Input			Output		
	Ha	Hb	Hc	La	Lb	Lc
L ($V_4 < 1.3V$)	1	0	1	H	L	M
	1	0	0	H	M	L
	1	1	0	M	H	L
	0	1	0	L	H	M
	0	1	1	L	M	H
	0	0	1	M	L	H
H ($3.9V < V_4 < V_{CC}$)	1	0	1	L	H	M
	1	0	0	L	M	H
	1	1	0	M	L	H
	0	1	0	H	L	M
	0	1	1	H	M	L
	0	0	1	M	H	L
M $2.4V < V_4 < 3.0V$ or Open	1	0	1	High Impedance (Stop)		
	1	0	0			
	1	1	0			
	0	1	0			
	0	1	1			
	0	0	1			

Note: "1" of the Hall Sensor input means that voltage above +20mV is applied to the positive side of each Hall Sensor from the negative side and "0" means that voltage above +20mV is applied to the negative side from the positive side.

In this case, needless to say, DC potential must be within the specified common mode voltage range of Hall Sensor input.

Further, "H", "M" and "L" of output mean $V_{CC} - V_{SAT1} = 1/2 V_{CC}$ and V_{SAT2} , respectively.

APPLICATION CIRCUIT

- Note 1. Recommendable value of R_f is 0.3 to 5 Ω . It depends on required initial torque, gain, coil impedance and control voltage of Pin 5.
- Note 2. To connect directly to IC Pin (Fin for F version and ⑬ Pin for P version) and GND to eliminate the influence of common impedance.
It is required to increase the value of this capacitance for stable operations in case of poor wiring or patterning of PCB.
- Note 3. Special care should be taken not to have a common impedance with GND line, RF GND line and Hall Sensor GND line.
- Note 4. Please select to optimum value for eliminate a vibration noise and parasitic oscillation. And also to change the connection (for example, each output to VCC or to R_f) for getting better characteristics.

TA8424F

TENTATIVE

3 PHASE HALL MOTOR DRIVER IC

TA8424F is non switching type 3 Phase Hall Motor Driver IC consisted of FG Amplifier, Regulator for Hall Sensors, control Amplifier and 3 Phase Output Drivers.

- . Low Noise (Quasi Sinusoidal Drive), Current Control Motor Driver.
- . Low Output Impedance with B Class Push-Pull Driver.
- . Output Current Up to 1.2A.
- . Operating Voltage Range : $V_{CC\ ovr}=7\sim 17V$
- . Built-in Thermal Shutdown Circuit, FG Amplifier and Regulator.
- . 2 Brake Modes Available (Short Brake and Dumping Brake).
- . Regulator for built-in Hall Sensors.

Weight: 0.8g (Typ.)

(1) Control Gain (G_{VC0})

Negative Feedback is looped by R_F and connected its line to (8) pin.

Feedback Voltage V_{NF} is generated by R_F and Output Current I_O .

It is possible to decrease the feedback by connecting a resistor between (10) pin and (8) pin.

Input current of $V_C(I_{C IN})$ vs V_C characteristic is shown below.

(2) FG Amplifier and Hysteresis Amplifier

2.5V of Internal Reference is equipped with FG Amplifier. FG signal is fed into $FGIN^+$ and $FGIN^-$ inputs with differential mode and outputs to FGO (18 pin). Amplified FG signal is wave shaped by Hysteresis Amplifier in following stage and outputs a wave shaped signal to FGS (17 pin).

(3) Regulator

Internal regulator outputs 5V and this current capability is up to 30mA.
 V_{CC} vs V_{reg} characteristic is shown below.

(4) FRS Input (Rotation Direction and Stop Control)

FRS input is a control terminal of Motor Rotation Direction and Stop.

Inputs V_{FRS} Voltage of less than 1.3V sets the Motor direction reverse, 1.9~3.1 sets stop and 4V V_{CC} sets the Motor forward direction.

V_{FRS} vs I_{FRS} characteristic is shown below.

APPLICATION CIRCUIT

Note 1. Connect if required (0.1~1 μ F)

Note 2. Care should be taken not to have common impedance between R_f GND Line and other small signal lines for stable operations (especially for Hall Sensor GND line).

TA8425H

PWM CHOPPER TYPE BIPOLAR STEPPING MOTOR DRIVER.

TA8425H is PWM chopper type sinusoidal micro step bipolar stepping motor driver. Sinusoidal micro step operation is accomplished only a clock signal inputting by means of built-in hard ware.

- . 1 chip bipolar sinusoidal micro step stepping motor driver.
- . Output current up to 1.5A(AVE) and 2.5A(PEAK).
- . PWM chopper type.
- . Structured by high voltage Bi-CMOS process technology.
- . Forward and reverse rotation are available.
- . 2, 1-2, W1-2, 2W1-2 phase 1 or 2 clock drive are selectable.
- . Package: CPP-25
- . 40k Ω (Typ.) of pull up resistors are provided with CK1,CK2, $\overline{\text{ENABLE}}$ terminals.
- . 40k Ω (Typ.) of pull down resistors are provided with M1,M2, REF IN terminals.

Weight: HZIP25-P: 9.9g

OSC FREQUENCY CALCULATION

Sawtooth OSC circuit consists of Q1 through Q4 and R1 through R4.

Q2 is turned "off" when VOSC is less than the voltage of 2.5V+VBE Q2 approximately equal to 3.2V.

VOSC is increased by COSC charging through R1.

Q3 and Q4 are turned "on" when VOSC becomes 3.2V (Higher level.)

Lower level of V (4) pin is equal to VBE Q2+VSAT Q4 approximately equal to 1.4V.

VOSC is calculated by following equation.

$$V_{OSC} = 5 \cdot (1 - e^{-\frac{1}{C_{OSC} \cdot R1} t})$$

Assuming that VOSC=1.4V (t=t1) and =3.2V (t=t2),

COSC is external capacitance connected to pin (4) and R1 is on-chip 10kΩ resistor.

Therefore, OSC frequency is calculated as follows.

$$t1 = -C_{OSC} \cdot R1 \cdot \ln \left(1 - \frac{1.4}{5} \right)$$

$$t2 = -C_{OSC} \cdot R1 \cdot \ln \left(1 - \frac{3.2}{5} \right)$$

$$f_{OSC} = \frac{1}{t2 - t1} = \frac{1}{C_{OSC} \left(R1 \cdot \ln \left(1 - \frac{1.4}{5} \right) - R1 \cdot \ln \left(1 - \frac{3.2}{5} \right) \right)}$$

$$\approx \frac{1}{6.93 \cdot C_{OSC}} \text{ (kHz) (COSC : } \mu\text{F)}$$

APPLICATION CIRCUIT

- (Note) Schottky diode (3GWJ42) to be connected additionally between each output (pin 16/19/20/23) and GND for preventing Punch-Through Current is recommended.
- (Note) GND pattern to be laid out at one point in order to prevent common impedance.
- (Note) Capacitor for noise suppression to be connected between the Power Supply (V_{CC}, V_M) and GND to stabilize the operation.

TA8428K

1.5A FULL BRIDGE DRIVER

TA8428K is Full Bridge Driver IC for Brush Motor Rotation Control that has current capability of up to 1.5A(AVE).

Thermal Shutdown and Short Current Protector are provided.

- . 1.5A MAX (AVE) Full Bridge Driver
- . 4 Modes (Forward/Reverse/Short Brake and Stop) are available with 2 TTL Compatible Inputs Control.
- . M-SIP 7 Compact SIP Package sealed.
- . Free wheeling diodes are equipped.
- . Multi Protection System Driver (Thermal Shutdown and Short Current Protector)
- . Operating Voltage : $V_{CC}=7.0\sim 27.0V$

Weight : 1.9g(Typ.)

APPLICATION CIRCUIT

Note. Recommend to take approximately 100μs of input dead time for reliable operations.

TERMINAL DESCRIPTION

PIN NUMBER	NAME	DESCRIPTION
1	IN 1	TTL Compatible Inputs. (PNP Type Low Active Comparator Inputs)
2	IN 2	
3	OUT 1	Output Terminals and Free Wheeling Diodes are connected between each output to GND and VCC.
5	OUT 2	
4	GND	GND Terminal
6	NC	Non connection
7	VCC	Supply Voltage Terminal for Control and Motor Drive.

TA8428K has 2 built-in protective functions which work independently. These circuit operations are as follows.

Thermal Shutdown

If junction temperature of TA8428K is over the specified temperature (150°C TYP.) by excess power dissipation or abnormal ambient temperature change, thermal Shutdown circuit turn "ON" and output 4 transistors become High impedance.

(All transistors turn "OFF")

Short Current Protector

Short current protector circuit senses all output transistor current. If output transistor current is over the specified limiting current value (3A TYP.), short current protector operates and all output transistors periodically turn "OFF"

(High Impedance Mode) in a period of approximately 80μs.

This state is continued until the release of over current mode.

INTERNAL CIRCUIT

APPLICATION NOTE

Wiring Requirements

- Care should be taken not to have a common impedance with output current line and logic (or control) signal GND lines for stable operations.
- Recommend to connect additional diodes between GND to Out and Out to V_{CC} terminals to improve braking characteristics and reliability.

MOUNTING REQUIREMENTS

TA8429H

3.0A FULL BRIDGE DRIVER

TA8429H is Full Bridge Driver IC for Brush Motor Rotation Control that has current capability of up to 3.0A(AVE).

Thermal Shutdown and Short Current Protector are provided.

And also Stand-by function available.

- . 3.0A(AVE) Full Bridge Driver with Independent Motor Driving Power Supply Terminal.
- . Stand-by Mode available : $I_{ST} \leq 100\mu A(\text{Max.})$
- . Thermal Shutdown and Short Circuit Protector Circuit are provided.
- . 4 Modes (Forward/Reverse/Short Brake and Stop) are available with 2 Low Active TTL Compatible Inputs Control.
- . Free Wheeling Diodes are equipped.
- . CPP12 Power Package Sealed.
- . Operating Voltage : $V_{CC}(\text{opr.}) = 7 \sim 27V$
 $V_S(\text{opr.}) = 0 \sim 27V$

TERMINAL DESCRIPTION

PIN NUMBER	NAME	DESCRIPTION
1	IN1	TTL compatible control inputs. (PNP type low active comparator inputs)
2	IN2	
3	NC	Non connection.
4	OUT1	Output terminals, free wheeling diodes are connected between each output with GND and V_S .
8	OUT2	
5	NC	Non connection.
6	GND	GND terminal.
7	NC	Non connection.
9	NC	Non connection.
10	V_S	Supply voltage terminal for Motor Drive.
11	VCC	Supply voltage terminal for control circuit.
12	ST	Stand-by terminal. Stand-by state is obtained with this terminal connected with GND (or Open).

NOTE

Recommend to take approximately 100 μ s of input dead time for reliable operations.

APPLICATION CIRCUIT-1 (Single Power Supply Operation)

APPLICATION CIRCUIT-2 (Dual Power Supply (Control and Motor) Operation)

Not to have a common impedance with other lines and use low impedance wire.

Note. Connect if required.

TA8430AF

STEPPING MOTOR DRIVER

TA8430AF is 2 Phase Bipolar Stepping Motor Driver IC designed especially for low operating voltage use FDD and other portable equipments.

- . 2 Phase Bipolar Stepping Motor Driver
- . Operating Voltage : $V_{CC\text{ opr}}=4\sim6V$
- . Power Save and Stand-by Mode available
: $I_{CC\text{ stand-by}} \leq 100\mu A$
- . Built-in Punch Through Current Restriction Circuit
- . 1,2 and 1-2 Phase Excitation Drive available
- . C-MOS Compatible Inputs (INA, INB, PS, ST)
- . Output Current up to 400mA(AVE) and 600mA(PEAK)
- . Sealed in PFP 16 SM Package

Weight : 0.50g (Typ.)

MAXIMUM RATINGS ($T_a=25^\circ C$)

TA8434F

SINGLE CHIP 3-PHASE MOTOR DRIVER FOR FDD SPINDLE MOTOR

The TA8434F is Single Chip Motor Driver IC for FDD Spindle Motor.

- . 1 Chip Motor Driver with 3-Phase Semi-Linear Driving.
- . Adjustment Free with Digital Servo System.
- . 300, 360rpm are Obtained.
- . Output Current : $I_O=0.7A$ MAX. (AVE)
- . Operating Voltage : $V_{CC}=4.25\sim 15V$
- . Built-in Thermal Shut-Down Circuit.
- . Built-in Over Voltage Protection Circuit.
- . Power Flat Package Sealed.
- . I^2L Structure.
- . Built-in Stand-by Circuit.

Weight : 0.6g(Typ.)

TA8435H

PWM CHOPPER TYPE BIPOLAR STEPPING MOTOR DRIVER.

TA8435H is PWM chopper type sinusoidal micro step bipolar stepping motor driver. Sinusoidal micro step operation is accomplished only a clock signal inputting by means of built-in hard ware.

- . 1 chip bipolar sinusoidal micro step stepping motor driver.
- . Output current up to 1.5A(AVE) and 2.5A(PEAK).
- . PWM chopper type.
- . Structured by high voltage Bi-CMOS process technology.
- . Forward and reverse rotation are available. Weight: HZIP25-P: 9.86g (Typ.)
- . 2, 1-2, W1-2, 2W1-2 phase 1 or 2 clock drives are selectable.
- . Package: HZIP25-P
- . Input Pull-up Resistor equipped with $\overline{\text{RESET}}$ and $\overline{\text{ENAELE}}$: R=100k Ω (TYP.)
- . Output Monitor available with $\overline{\text{MO}}$. $\text{IO}(\overline{\text{MO}}) = \pm 2\text{mA MAX.}$
- . Reset and Enable are available with $\overline{\text{RESET}}$ and $\overline{\text{ENABLE}}$.

OSC FREQUENCY CALCULATION

Sawtooth OSC circuit consists of Q1 through Q4 and R1 through R4.

Q2 is turned "off" when V_{OSC} is less than the voltage of $2.5V + V_{BE}$ Q2 approximately equal to 2.85V.

V_{OSC} is increased by C_{OSC} charging through R1.

Q3 and Q4 are turned "on" when V_{OSC} becomes 2.85V(Higher level).

Lower level of V ④ pin is equal to V_{BE} Q2 + V_{SAT} Q4 approximately equal to 1.4V.

V_{OSC} is calculated by following equation.

$$V_{OSC} = 5 \cdot (1 - e^{-\frac{1}{C_{OSC} \cdot R1} t})$$

Assuming that $V_{OSC}=1.4V$ ($t=t1$) and $=2.85V$ ($t=t2$)

C_{OSC} is external capacitance connected to pin ④ and R1 is on-chip 10k Ω resistor.

Therefore, OSC frequency is calculated as follows.

$$t1 = -C_{OSC} \cdot R1 \cdot \ln \left(1 - \frac{1.4}{5} \right)$$

$$t2 = -C_{OSC} \cdot R1 \cdot \ln \left(1 - \frac{2.85}{5} \right)$$

$$f_{OSC} = \frac{1}{t2 - t1} = \frac{1}{C_{OSC} \left(R1 \cdot \ln \left(1 - \frac{1.4}{5} \right) - R1 \cdot \ln \left(1 - \frac{2.85}{5} \right) \right)}$$

$$\div \frac{1}{5.15 \cdot C_{OSC}} \text{ (kHz) } (C_{OSC} : \mu F)$$

APPLICATION CIRCUIT

(Note. 1) Schottky diode (3GWJ42) to be connected additionally between each output (pin 16/19/20/23) and GND for preventing Punch-Through Current

(Note. 2) GND pattern to be laid out at one point in order to prevent common impedance.

(Note. 3) Capacitor for noise suppression to be connected between the Power Supply (V_{CC} , V_M) and GND to stabilize the operation.

EXCITATION

2 Phase Excitation (M1:L, M2:L)

1-2 Phase Excitation (M1:H, M2:L)

W1-2 Phase Excitation (M1:L, M2:H)

2W1-2 Phase Excitation (M1:H, M2:H)

ENABLE AND RESET FUNCTION AND MO SIGNAL

ENABLE Signal disables only Output Signal.

Internal logic functions are proceeded by CK signal without regard to ENABLE signal. Therefore, Output Current is initiated from the proceeded timing point of internal logic circuit after release of disable mode.

Fig.1 shows the ENABLE functions, when the system is selected in 1-2 Phase drive mode.

Fig.1 1-2 Phase drive mode (M1:H, M2:L)

Outputs are initiated from the initial point after release of RESET (High) as shown in Fig. 2.

Fig. 2 1-2 Phase drive mode (M1:H, M2:L)

Low level active of $\overline{\text{RESET}}$ initializes internal decoder and $\overline{\text{MO}}$ becomes low.

$\overline{\text{MO}}$ (Monitor Output) Signals can be used as rotation and initial signal for stable rotation checking.

TA8436AF

TENTATIVE DATA

SMART MOS DUAL H-BRIDGE DRIVER IC

TA8436AF is a monolithic type bridge driver IC, which is composed of 4 MOS FETs output and control circuit for Forward, Reverse and Breaking function by direct connection with MCU.
Breaking characteristics is very speedy and powerful.

- Direct Interface with MCU
- 4 Mode Functions (Forward, Reverse, Break, Stip)
- Low On-resistance 620Ω
(at Forward, Reverse, $I_D=1.0A$)
- $I_D=3.0A$ Peak
- Low Power Dissipation
- Built-in Charge Pump
- 20 pin Mini Flat Package
- Compatible with MPC1710BM

Weight : 0.16g(Typ.)

TENTATIVE DATA

SMART MOS DUAL H-BRIDGE DRIVER IC

TA8437F is monolithic type Smart MOS IC 2 ways H-bridge driver IC, which employs 2 units of H-bridge composed of MOS FET output and their control unit.

This IC is suitable for low voltage operating stepping motor application.

- . Direct Operation by Logic Level Signal from MPU, etc.
- . High Efficiency for Control-system (CMOS structure) and Output Stage (MOS FET structure)
- . Low On-resistance
- . Low Power Dissipation
- . Built-in Charge Pump
- . Built-in Power Save Function
- . 20 pin Mini Flat Package
- . Compatible with MPC1711M

TA8440H

TENTATIVE DATA

DC MOTOR FULL BRIDGE DRIVER

The TA8440H is a full-bridge driver for selecting the forward and reverse running of a motor with brushes and is able to control 4 modes of forward, reverse, stop and braking.

The motor driving unit and the control unit have a separate power supply line, independently and the TA8440H is also usable as a stepping motor driver.

- . Output Current is as large as 1.5A(AVE) and 3.0A(PEAK).
- . 4 modes of forward, reverse, stop, and braking are available and a counter-electromotive force absorbing diode has been built-in.
- . Thermal Shutdown Circuit Incorporated.
- . Input is Compatible with CMOS.
- . Built-in Input Pull-up Resistor. BRAKE=40k Ω (Typ.)
- . Built-in Input Pull-down Resistor. IN,ENABLE=40k Ω (Typ.)

Weight : 3.97g (Typ.)

TA8443F

PLL-PWM 3-PHASE HALL MOTOR PRE-DRIVER

TA8443F is 3-phase hall motor pre-driver with PLL controller and PWM controller.

8 bit D/A converter system has been employed for each of the speed control system (AFC) and the phase control system (APC).

TA8443F contains two error amplifiers, adjustable oscillator, dead-time control comparator, pulse-steering flip-flop, and output-control circuit.

- . This is multi-chip IC with TC9203, TA76494 and TA7712.
- . Start/stop, CW/CCW and brake function are provided.
- . Package is OFF-60.
- . For further details, refer to each technical data.

Weight : 0.8g(Typ.)

PLL PART OPERATION

1. Crystal oscillation terminals ($X_T, \overline{X_T}$)

- The crystal oscillator is used by connecting as shown below.

- C_L of 10~30pF is appropriate.

- Crystal oscillation frequency is calculated by the following equation according to number of FG pulses of a motor to be used.

$$f_X = \frac{R}{60} \times FG' \times 128 \times (20 \text{ or } 27) \times N \quad (\text{Hz})$$

(Note) (20 or 27): 20 at 20/27="H" or Open.

27 at 20/27="L".

f_X : Crystal oscillation frequency, FG' : number of FG pulse generated per revolution of motor, R : revolution of motor per minute, N : Ratio of frequency division of the crystal reference frequency divider. (Refer to Item 9.)

- Maximum operating frequency is above 8MHz and crystals up to 8MHz can be used.

2. Reference frequency input/output terminals (CPIN, CPOUT)

- Divided output $\frac{f_X}{N}$ from the crystal reference frequency divider is available at CPOUT, which is normally connected CPIN.
- When an external oscillator (CR oscillator, etc.) is connected to CPIN, motor speed can be finally adjusted.

3. FG pulse input terminal (FG_{IN})

- This is the input terminal of FG pulse that shows the motor speed.
This FG pulse becomes comparison frequency.
- This terminal has built-in Amplifier and Schmitt circuit.
FG pulses are applied through capacitor coupling and small amplitude is enough for proper operation.

4. Lock range switching terminal (20/27)

- This terminal is for switching lock range of motor, with a pull-up resistor and chattering preventive circuit.

(TRUTH TABLE)

20/27	DIVIDED FREQUENCY	LOCK RANGE
L	1/27	+3.4~-3.9% of reference cycle
H or NC	1/20	+4.6~-5.3% of reference cycle

5. APC, AFC output terminal (APC, AFC)

- AFC (speed control output) is a F-V converter for FG frequency, and is consisting of a 8 bit D/A converter.
- APC (phase control output) is a phase comparator (ϕ -V converter) that compares phase difference ϕ between 1/2 FG and reference frequency FS', and is also consisting of a 8 bit D/A converter.
- Both APC and AFC perform the following 3 operations according to FG_{IN} frequency.
 - a. When FG_{IN} frequency is within the lock range:
Both APC and AFC perform the normal operation for FG_{IN}.
 - b. When FG_{IN} frequency is below the lock range (under speed):
APC and AFC outputs are both fixed at "H" level.
 - c. When FG_{IN} frequency is above the lock range (over speed):
APC and AFC outputs are both fixed at "L" level.
- When a motor is in STOP state (P/S=H or NC), both AFC and PAC are fixed "L" level.

AFC Output change status for FG_{IN} frequency

APC Output change status for phase difference ϕ

• AFC and APC timing chart within lock range.

a. AFC (SPEED CONTROL SYSTEM)

b. APC (PHASE CONTROL SYSTEM)

6. Lock detecting terminal (LD)

- This terminal is the lock detecting output and is placed at "H" level when FG_{IN} frequency is within the lock range and otherwise, placed at "L" level.

7. RUN/STOP input terminal (R/S)

- RUN/STOP signals of the motor are input to this terminal.
- This terminal has a pull-up resistor and a chattering preventive circuit.
- During RUN (R/S=L), AFC, APC and LD perform the above-mentioned operations for FG_{IN} frequency, and during STOP (R/S=H or NC), AFC, APC and LD are all fixed at "L" level.

8. Reverse signal output terminal (RV)

- At the switching of lock range from 1/20 to 1/27 or the operating from RUN to STOP, reverse signal for braking the motor is output through this terminal.
- Change of RV output status

PREVIOUS STATUS	RV OUTPUT CHANGE TO "H" LEVEL	RV OUTPUT CHANGE TO "L" LEVEL
During normal rotation (during lock) at 1/20.	When the lock range is switched from 1/20 to 1/27.	When the motor speed is locked at 1/27, or when FG _{IN} 1/8FS, or when the lock range is switched from 1/27 to 1/20.
During normal rotation (during lock) at 1/20 or 1/27.	When the operation is switched from RUN to STOP.	When FG _{IN} 1/8FS or when the operation is switched from STOP to RUN.

- In other cases than above, RV output is not changed and fixed at "L" level.
- Further, if FG frequency rises up to 1.5 times of normal rotation at 1/20 (2 times of normal rotation at 1/27), RV output is reset.

9. Referecne divided frequency switching terminal (N1, N2)

- Divided frequency 1/N of the crystal reference frequency divider can be switched to 1/5, 1/6 or 1/12 by number of FG pulses or a crystal used.
- This terminal has a built-in pull-up resistor.

(TRUTH TABLE)

N1	N2	1/N
H	H	1/5
L	H	1/6
H	L	1/12

1/N: CRYSTAL REFERENCE DIVIDED FREQUENCY

(Note) Don't use mode, N1=N2="L", because this mode is test mode.

CAUTION IN APPLICATION

- APC and AFC terminals are for the 8-bit D/A converter outputs, which are directly output from the R-2R ladder type resistor network as shwon in the following diagram. Impedance of these outputs becomes equal to the ladder resistor value R_L . Therefore, input impedance at the receiving side of these terminals shall be designed accordingly.

- A filter for an externally mounted differential amplifier on an application circuit shall be selected to meet the response characteristic of a motor to be used.

PWM PART OPERATION

The uncommitted output transistors provide either common-emitter or emitter-follower output capability.

Push-pull or single-ended output operation may be selected through the output-control function.

The architecture of the TA8443F prohibits the possibility of either output being pulsed twice during push-pull operation.

VOLTAGE WAVEFORMS

CONTROLLER PART OPERATION

1. TIMING CHART

FORWARD ROTATION (Position sensing signal advances $H_a \rightarrow H_b \rightarrow H_c$.)REVERSE ROTATION (Position sensing signal advances $H_a \rightarrow H_c \rightarrow H_b$.)

2. APPLICATION OF CONTROLLER PART

Like a video disk player, TA8443P is provided with the stopping function which in a short time, stops the motor having a large inertia, and makes the quick disk-change possible. To make the frequency generator (FG) unnecessary which was formerly required for fetching the rotation signal, the signal from the position sensing input is ORed and is output to FG output pin (44 pin). Therefore, for FG output, three position sensing outputs (Ha, Hb, Hc) are ORed, and the rotation speed signal of the frequency of six times that of one output can be fetched resulting in making it possible to obtain a sufficient controlling characteristic with the F/V (Frequency-Voltage) conversion method of mono-stable type.

(1) Operation of FG Output (44 pin) and TFG (45 pin)

In Fig. 1, Q1 and Q3 are the mono-stable multivibrator to which gate (Q2 base) the signal from each position sensing input of Ha, Hb and Hc is input after ORed and shaped in waveform by FE. The pulse width of MMV made by Q1 and Q2 is determined by R2 and C2 to be connected to TFG (45 pin), and the square wave having the pulse width to be determined by C2 and R2 is output.

Of course, this frequency is proportional to the rotation signal and this frequency is six times the frequency of each position sensing. (6 per 1 electrical rotation) F/V conversion operation is made through connecting FG0 output to LPF for integration. However, if R2 is made variable, the conversion gain can be controlled.

Fig. 1

L	H/L	H/L	STOP mode

Note: In STOP mode, (38), (39), (54), (55), (56) and (57) pins of output are all made OFF. In BRAKE mode, (39), (55) and (57) pins of output are made ON. (sweep-out mode)

(3) Output Circuit

As shown in the block diagram, in the output circuit, the Darlington emitters of PNP and NPN are provided on the upper side, and the lower side is made as the open collector or NPN.

Connect the external transistor in the same manner as that of the application circuit.

TA8453AF

3 PHASE HALL MOTOR DRIVER WITH PLL CONTROLLER

The TA8453AF is a multi-chip IC with PLL controller and TA7259P.

This is suitable for Polygon Mirror Drive for LBP, and FAX etc.

- . 8 bit D/A converter system has been employed for each of the speed control system (AFC) and the phase control system (APC), and realize a free adjustment motor control system.
- . Output Current : $I_O=1.2A$ (MAX.)
- . Forward rotation, reverse rotation, and stop are controlled by 1 terminal signal control.
- . Crystal can be used up to 8MHz, and crystal reference dividing frequency selected from three position 1/5, 1/6 and 1/12.
- . Lock range selected from two position of about 3.6% and about 5.0%.
- . Operating Supply Voltage : $V_{CC}=7\sim 27V$

Weight : 0.61g(Typ.)

PLL PART

OPERATION

1. Crystal oscillation terminals (X_T , $\overline{X_T}$)

- The crystal oscillator is used by connecting as shown below.

. C_L of 10~30pF is appropriate.

Crystal oscillation frequency is calculated by the following equation according to number of FG pulses of a motor to be used.

$$f_X + \frac{R}{60} \quad FG' \times 128 \times (20 \text{ or } 27) \times N \quad (\text{Hz})$$

(Note) (20 or 27) : 20 at 20/27="H" or Open.
27 at 20/27="L".

f_X : Crystal oscillation frequency, FG' : number of FG pulse generated per revolution of motor, R : revolution of motor per minute.

N : Ratio of frequency division of the crystal reference frequency divider.

(Refer to Item 9.)

- Maximum operating frequency is above 8MHz and crystals up to 8MHz can be used.

2. Reference frequency input/output terminals (CP_{IN} , CP_{OUT})

- Divided output $\frac{f_X}{N}$ from the crystal reference frequency divider is available at CP_{OUT} , which is normally connected CP_{IN} .
- When an external oscillator (CR oscillator, etc.) is connected to CP_{IN} , motor speed can be finally adjusted.

3. FG pulse input terminal (FG_{IN})

- . This is the input terminal of FG pulse that shows the motor speed.
This FG pulse becomes comparison frequency.
- . This terminal has built-in Amplifier and Schmitt circuit.
FG pulses are applied through capacitor coupling and small amplitude is enough for proper operation.

4. Lock range switching terminal (20/27)

- . This terminal is for switching lock range of motor, with a pull-up resistor and chattering preventive circuit.

(TRUTH TABLE)

20/27	DIVIDED FREQUENCY	LOCK RANGE
L	1/27	+3.4~-3.9% of reference cycle
H or NC	1/20	+4.6~-5.3% of reference cycle

5. APC, AFC output terminal (APC, AFC)

- . AFC (speed control output) is a F-V converter for FG frequency, and is consisting of a 8 bit D/A converter.
- . APC (phase control output) is a phase comparator (ϕ -V converter) that compares phase difference ϕ between 1/2 FG and reference frequency FS', and is also consisting of a 8 bit D/A converter.
- . Both APC and AFC perform the following 3 operations according to FG_{IN} frequency.
 - a. When FG_{IN} frequency is within the lock range:
Both APC and AFC perform the normal operation for FG_{IN}.
 - b. When FG_{IN} frequency is below the lock range (under speed):
APC and AFC outputs are both fixed at "H" level.
 - c. When FG_{IN} frequency is above the lock range (over speed):
APC and AFC outputs are both fixed at "L" level.
- . When a motor is in STOP state (P/S=H or NC), both AFC and APC are fixed "L" level.

AFC Output change status for FG_{IN} frequency

APC Output change status for phase difference ϕ .

. AFC and APC timing chart within lock range.

a. AFC (SPEED CONTROL SYSTEM)

b. APC (PHASE CONTROL SYSTEM)

6. Lock detecting terminal (LD)

- . This terminal is the lock detecting output and is placed at "H" level when FG_{IN} frequency is within the lock range and otherwise, placed at "L" level.

7. RUN/STOP input terminal (R/S)

- . RUN/STOP signals of the motor are input to this terminal.
- . This terminal has a pull-up resistor and a chattering preventive circuit.
- . During RUN ($R/S=L$), AFC, APC and LD perform the above-mentioned operations for FG_{IN} frequency, and during STOP ($R/S=H$ or NC), AFC, APC and LD are all fixed at "L" level.

8. Reverse signal output terminal (RV)

- . At the switching of lock range from 1/20 to 1/27 or the operating from RUN to STOP, reverse signal for braking the motor is output through this terminal.
- . Change of RV output status

PREVIOUS STATUS	RV OUTPUT CHANGE TO "H" LEVEL	RV OUTPUT CHANGE TO "L" LEVEL
During normal rotation (during lock) at 1/20.	When the lock range is switched from 1/20 to 1/27.	When the motor speed is locked at 1/27, or when FG_{IN} 1/8FS, or when the lock range is switched from 1/27 to 1/20.
During normal rotation (during lock) at 1/20 or 1/27.	When the operation is switched from RUN to STOP.	When FG_{IN} 1/8FS or when the operation is switched from STOP to RUN.

- . In other cases than above, RV output is not changed and fixed at "L" level.
- . Further, if FG frequency rises up to 1.5 times of normal rotation at 1/20 (2 times of normal rotation at 1/27), RV output is reset.

9. Reference divided frequency switching terminal (N1, N2)

- Divided frequency $1/N$ of the crystal reference frequency divider can be switched to $1/5$, $1/6$ or $1/12$ by number of FG pulses or a crystal used.
- This terminal has a built-in pull-up resistor.

(TRUTH TABLE)

N1	N2	1/N
H	H	1/5
L	H	1/6
H	L	1/12

1/N: CRYSTAL REFERENCE DIVIDED FREQUENCY

(Note) Don't use mode, $N1=N2="L"$, because this mode is test mode.

CAUTION IN APPLICATION

- APC and AFC terminals are for the 8-bit D/A converter outputs, which are directly output from the R-2R ladder type resistor network as shown in the following diagram. Impedance of these outputs becomes equal to the ladder resistor value R_L . Therefore, input impedance at the receiving side of these terminals shall be designed accordingly.

- A filter for an externally mounted differential amplifier on an application circuit shall be selected to meet the response characteristic of a motor to be used.

DRIVER PART

INPUT/OUTPUT CHARACTERISTICS

V_{NF} shows voltage drop at R_F .

That is, in the case of star connection, when coil current is I_L ,

$$V_{NF} = R_F \cdot I_L$$

See the following circuit.

Further, if inputs (13 pin, 14 pin) are shorted or $V_{13} \geq V_{14}$, torque at the circuit becomes zero. However, this zero torque state also can be obtained by setting FRS input (12 pin) to specified voltage or by placing the circuit in open state and this is rather advantageous as current consumption is less.

FUNCTION

FRS (CW/CCW/STOP) INPUT	POSITION SENSING INPUT			OUTPUT		
	Ha	Hb	Hc	La	Lb	Lc
L	1	0	1	H	L	M
	1	0	0	H	M	L
	1	1	0	M	H	L
	0	1	0	L	H	M
	0	1	1	L	M	H
	0	0	1	M	L	H
H	1	0	1	L	H	M
	1	0	0	L	M	H
	1	1	0	M	L	H
	0	1	0	H	L	M
	0	1	1	H	M	L
	0	0	1	M	H	L
M	1	0	1	High Impedance		
	1	0	0			
	1	1	0			
	0	1	0			
	0	1	1			
	0	0	1			

Note: "1" of the hole element input means that voltage above +10mV is applied to the positive side of each hall element from the negative side and "0" means that voltage above +10mV is applied to the negative side from the positive side. In this case, needless to say, DC potential must be within the specified common mode voltage range of hall element input.

Further, "H", "M" and "L" of output mean $V_{CC}-V_{SAT1}=1/2 V_{CC}$ and V_{SAT2} , respectively, and "L", "H" and "M" of FRS input mean application of voltage within specified values of V_F , V_R and V_S , respectively.

Further, by applying required voltage for control input (V_{IN+} , V_{IN-}), measure the circuit in operating state.

CONTROL SIGNAL INPUT METHOD

Normally, control voltage which is proportional to (or inversely proportional to) rotation speed (F/V converter etc.) is fed into the front stage of the TA7259P differentially or single polarity. The gain from control input of the TA7259P to output (at R_F terminal) is 5.5 times as indicated in the specification. It is however possible to improve characteristic of W/F, etc. by reducing the gain with NF applied.

It's application example is shown in the diagram below. Further, when NF is applied (Also, when not applied), it is necessary that DC voltages (V_{I3}, V_{I4}) of control inputs (13 pin, 14 pin) are within the range of values (2.0~V_{CC}-2.5V) shown in the standard.

In addition, when input DC level and F/V converted output (control output) cannot be matched with IC input, a DC level shift diode and attenuator should be inserted in front of IC input. An example is shown in Fig. 1-c.

a) IN CASE OF POSITIVE INPUT

$$(N \propto \frac{1}{V_{cont}})$$

Fig. 1-a

b) IN CASE OF NEGATIVE INPUT

$$(N \propto V_{cont})$$

DC level of control output is shifted by a zener diode and control signal output is attenuated by R_1 and R_2 .

Fig. 1-c

CAUTIONS IN APPLICATION

IC for motor drive have several high impedance input terminals such as hall element input, control signal input, etc. and to handle a switched high output current. Because of such a reason. Care should be taken not to make a parasitic oscillation path caused by unnecessary feedback.

Further, as load is a coil, it is necessary to pay attention to prevent destruction by impulse at time of ON/OFF, particularly, application of voltage and current in excess of standard values to the output transistor when supply voltage is at high level ($V_{CC}=18V$ or above). It is recommended to use the TA7259P at supply voltage below 18V. If it is used supply voltage above this value, the above-mentioned cautions should be followed.

(1) CAUTIONS FOR RELIABILITY DESIGN

- a) Do not into the output transistor inside IC into the high voltage and current operating region.
(Especially, when a motor is locked, V_{CC} is ON/OFF, output is shorted, etc.)
- b) It is desirable to design the output ringing absorbing capacitor in capacitance as small as possible (the output transistor may be destructed by charging/dis-charging current of this capacitor in some cases).
If it becomes a problem, it is recommended to review not only capacitance but also connecting point and connecting method (delta or star connection) in addition to taken an oscillation preventing measure described later furthermore, to insert resistor (3Ω to 30Ω) in series to the capacitor.
- c) In installing to a printed circuit board, be careful not to apply an abnormal force to the fin of IC and moreover, to solder in several seconds (at $260^{\circ}C$).
- d) It is an effective method for assuring reliability to provide a large earthing area on a printed circuit board to promote heat-eadiation from the soldered fin of IC.

(2) CAUTIONS FOR WIRING

It is recommend to design a print pattern with the following methods taken into consideration in order to prevent parasitic oscillation.

- a) The output coil current path line should be provided separately from other earth one because the coil current includes switched high current.

In particular, it is recommended to design a line from R_F terminal (6 pin) to the earth so that it's impedance does not become common to other circuits.

(This is especially important.)

If this is not possible or oscillation cannot be eliminated completely, it is advised to connect a capacitor of $0.001\sim 0.1\mu F$ parallelly with R_F .

- b) It is also recommended to provide the hall element drive current path independently. (Especially, separately from the output current path)

Further, if plunging input to the position sensing element is expected, it is advised to insert a capacitor of $0.05\sim 1\mu F$ between the plus (+) and minus (-) terminals of each position sensing input. In addition, it should be also consider to insert resistors in series to all hall element inputs. If plunging input to control input is expected, connect a capacitor of $0.001\sim 0.1\mu F$ between control terminal and GND.

- c) If parasitic oscillation in a high frequency range above 5MHz is observed, commonly connect the capacitors from all coil outputs and connect a capacitor ($C=0.01\sim0.1\mu F$) to R_F terminal (6 pin) from this connecting point (Fig. 4-a). Further, it is also recommended to consider a method to connect capacitors to R_F terminal from respective coil outputs separately from the ringing absorbing capacitor (Fig. 4-b).

Fig. 4-a

Fig. 4-b

- d) It is recommended to connect a path capacitor directly from V_{CC} terminal (10 pin) without giving common impedance to GND. Further, it is also effective to insert C_2 ($0.01\sim0.1\mu F$).

Fig. 5

(3) CONNECTION OF OUTPUT RINGING ABSORBING CAPACITOR

It is advised to connect the output ringing absorbing capacitor to GND from each coil terminal. In addition, it is also advised to consider the following methods from the viewpoint of parasitic oscillation prevention as well as destruction prevention.

- a) Change of capacitance
- b) Delta connection (Fig. 6-a)
- c) Connection to V_{CC} instead of GND (Fig. 6-b). In this case, however, attention should be paid to destruction. If voltage/current locus is outside ASO, it is necessary to connect resistors in series with capacitors. And propose to connection to R_F terminal.
- d) Connect resistors in series with capacitor (Fig. 6-c).
- e) Combination of a), b), c) and d).

Fig. 6-a

Fig. 6-b

Fig. 6-c

OTHER CAUTIONS

Depending upon capacity and connecting method of the output capacitor, the output transistor inside IC may be destructed in some cases and it is therefore recommended obtain voltage/current locus of the output transistor through the measurement shown below and confirm that the locus is within ASO. (Especially, the measurement at time of SW ON/OFF, CW rotation→CCW rotation→CW rotation is important).

Table 1 Demographic characteristics of study population

APPLICATION CIRCUIT

TA8459F

SMART MOS DUAL H DRIVER IC

The TA8459F is a dual H driver IC developed for driving various motors and actuators of portable CD players and cameras.

- Direct interface with MPU is possible.
- Connectable directly to the TC9220F, the servo processor for CD player.
- The power stage is dual type with high output current.

$$I_O \text{ (Average)} = 300\text{mA}$$

$$I_O \text{ (Peak)} = 500\text{mA}$$

- Low output on resistance.

$$R_{ON} \text{ (Standard)} = 1.0\Omega \text{ (} I_O=200\text{mA)}$$

- Low current consumption.
- 2 channels are connectable in parallel with each other.
- Built-in charge pump circuit.
- Built-in output stage pass through current preventive circuit.
- High speed operation. ($f_{IN}(\text{Max})=100\text{kHz}$)
- 20-pin mini-flat package, enabling compact design.

Weight : 0.48g(Typ.)

EXAMPLE OR APPLICATION CIRCUIT

TA8460F

DUAL H DRIVER IC WITH SMART MOS PWM Pre-DRIVER

The TA8460F is a dual H driver IC with PWM pre-driver developed for driving various kinds of motors and actuators in portable CD player, camera and FDD.

- . Built-in PWM pre-driver.
High efficiency and low current consumption.
- . Built-in AGC circuit for improving driver efficiency.
- . Dual output type with high output current.
 I_O (Average) = 300mA
 I_O (Peak) = 500mA
- . Low output ON resistance.
 $R_{ON}(Typ.)=1.0\Omega$ ($I_O=200mA$)
- . Built-in charge pump circuit.
- . Output stage penetrating current preventive circuit.
- . 32-pin mini flat package.
Compact size design is enabled.

Weight : 0.172g (Typ.)

EXAMPLE OF APPLICATION CIRCUITS

(Example-1) CD Player PUH Actuator Coil Control

Constants in the application circuit example are decided by (1)~(3):

(1) Gain setting method:

$$\text{Gain (G)} = \frac{R_4}{R_3 + R_4} \times \frac{R_1}{R_2} \times \frac{V_D}{1.2(V)}$$

(2) Open loop characteristic:

(3) Decision of C_T (Sawtooth wave generating charge/discharge): ($C_{u1}=C_{u2}=C_C=0.01\mu\text{F}$)

$$C_T = \frac{88.2 \times 10^3}{f_{IN}(\text{kHz})} = 1000\text{pF} \quad (\text{at } f_{IN}=88.2\text{kHz})$$

TA8461F

DUAL POWER OPERATIONAL AMPLIFIER

The TA8461F is a multiple chip IC consisting of 4 saturated voltage discrete transistors and 1 dual operational amplifier.

- Large Output Current : $I_{OUT}=1.5A(Max.)$
- Sealed in a Small Package : SSOP24

TEST CIRCUIT

(1) V_{IO} , SVRR

- $V_{IO} = V_{OUT}/100$
- $SVRR = 20 \log E \text{ (dB)}$

$$E = \left| \frac{V_{OUT1} - V_{OUT2}}{V_{CC1} - V_{CC2}} \right| \times \frac{1}{100}$$

V_{OUT1} : V_{OUT} ($V_{CC1} = 5V$)

V_{OUT2} : V_{OUT} ($V_{CC2} = 10V$)

(2) I_I , I_{IO}

$I_I(-)$

$I_I(+)$

$$I_{IO} = |I_I(-) - I_I(+)|$$

(3) CMV_{IN} , CMRR

- $CMRR = 20 \log G_D/G_C \text{ (dB)}$
 G_D : Differential Voltage Gain
 G_C : In-phase Voltage Gain
- CMV_{IN} : $V_{IN} = 0V$, $V_{CC} = 1.5V$

(4) I_{CC}

• $I_{CC} : V_{CC}=5V$

(5) G_V

• $G_V=20\log e_o/e_i$ (dB)

$R \gg 1/\omega C_1$

C_1 : For Preventing DC Short-Circuit.

C_2 : For High Frequency Short-Circuit.

Use a Mica or Titanium Capacitor.

(6) V_{Op-p} , I_{source} , I_{sink}

• V_{Op-p}

V_{OH} : SW1 is to A side.

V_{OL} : SW1 is to B side.

• I_{source}

SW1 is to A side.

$V_{OUT} \rightarrow 0V$ Measurement

• I_{sink}

SW1 is to B side.

$V_{OUT} \rightarrow 5V$ Measurement

CHARACTERISTIC CURVES (Ta=25°C)

TA8462F

FAN MOTOR DRIVER IC

The TA8462F is a two-phase half-wave hall motor driver IC.

This IC is best suited for the fan motor driving. The output current of this IC is 1.5A(peak) and all functions needed for fan motor driving have been incorporated into a 1 chip, enabling it to largely reduce peripheral parts and a space, thus realizing down-sizing.

Further, the TA8462F is provided with the FG output pin (outputs pulses proportional to the motor speed) and the RD output pin (outputs the motor ON/OFF statues).

Weight : 0.09g(Typ.)

- . Built-in Automatic Self Rotation Recovery Circuit After Release of Motor Locking.
- . Thermal Shutdown Circuit Incorporated.
- . Operating Voltage : 4~15V
- . Recommended Operating Voltage : $V_{CC}=5V, 12V$
- . No V_{CC} -GND Reverse Connection Preventive Diode Required.

MAXIMUM RATINGS ($T_a=25^{\circ}C$)

CHARACTERISTIC	SYMBOL	RATING	UNIT

BLOCK DIAGRAM

○ FG and RD Outputs

Both the FG and RD outputs are the open collector outputs.

The FG output is pulse proportional to the number of revolutions (the cycle is the same as OUT B) and the RD output is at the GND level (actually, at $V_{sat}(RD)$ level) when the motor is being driven and the RD output at the potential level that is to be applied to the RD terminal as shown in Figure 2 is output when the motor is kept restrained.

○ Automatic Self Rotation Recovery Circuit

Fig. 1

If the rotation of the fan motor is forced to stop by any physical power, the driving coil may be burnt as inducing voltage caused when the motor is running disappears and large current flows to the driving coil.

Therefore, it becomes necessary to provide the fan motor with a circuit to prevent the driving coil from being burned by detecting the forced stop of the motor rotation from the outside by some method and a circuit to automatically rotate the motor when it is released from the restraint.

The TA8462F is an IC that has cleared the above problems by the burning preventive automatic return circuit.

This operation is shown in Figure 1.

The capacitor C_{SC} connected to the C_{SC} terminal is charged by the charging current I_{SL} (6.3 μ A TYP) and its potential rises as shown below:

$$V = \frac{1}{C_{SC}} I_{SC} dt$$

When the motor is rotating, it is charged and discharged repeatedly by trigger pulse but if the motor rotation is physically restrained, C_{SC} discharge by trigger pulse is stopped and the potential further increases. During this period, current flows continuously to the motor. If V_{SC} (OSC potential) reaches V_{SCU} (3.5V TYP), discharge starts slowly and at the same time, the output is turned OFF to cut off current flowing to the motor. When the V_{SC} potential reaches V_{SCL} (1.5V TYP), the output is turned ON to allow current flow to the motor and torque is generated. As long as the motor rotation is kept restrained, this operation is repeated and the output is turned ON/OFF at a ratio of nearly 1 : 5. By this operation, the motor is heated and cooled and its temperature rise can be suppressed to a certain level. If the motor is released from the above restraint, the motor is started to run again by the generated torque and is continuously rotated by the generated trigger pulse.

APPLICATION CIRCUIT

- $12V\mu se$

- $5V\mu se$

Note 1 : If the mutual induction of a motor is large, it is recommended to insert a diode in the circuit.

TA8463F

SINGLE CHIP 3-PHASE MOTOR DRIVER FOR FDD SPINDLE MOTOR.

The TA8463F is Single Chip Motor Driver IC for
FDD Spindle Motor.

- . 1 Chip motor driver with 3-phase semi-linear driving.
- . Adjustment free with digital servo system.
- . 300, 360rpm are obtained.
- . Built-in index pulse output current.
- . Operating supply voltage range : $V_{CC}=4.2\sim 7V$
- . Output current : $I_O(\text{MAX})=0.5A(\text{AVE})$
- . Built-in thermal shut-down circuit.
- . Built-in over current protection circuit.
- . Built-in stand-by circuit.

Weight : 0.6g (Typ.)

TA8464K

DUAL POWER OPERATIONAL AMPLIFIER

The TA8464K is a dual power operational amplifier with the output current 1.2A MAX.

This amplifier is usable for CD player arm driver, brushed motor forward/reverse rotation control driver, and FDD/HDD voice coil motor.

Furthermore, this amplifier is best suited for LDP focus tracking actuator driver because of its high through rate.

- . Provided with a Current Limiter.
- . High Output Current : $I_O \text{ MAX(peak)} = 1.2\text{A}$
- . Internal Phase Compensation Type.
- . Less Crosstalk : $C_T = 55\text{dB(Typ.)}$
- . High Slew Rate : $S_L = 1.0\text{V}/\mu\text{s(Typ.)}$

Weight : 2.47g(Typ.)

MAXIMUM RATINGS ($T_a = 25^\circ\text{C}$)

CHARACTERISTIC	SYMBOL	RATING	UNIT

TA8466F

3 PHASE HALL MOTOR DRIVER

The TA8466F is 3 Phase Hall Motor Driver IC for VCR Deck cylinder motor drive.

- Low Noise by Soft Switching Drive
- Forward Drive
- Small External Condensor Capacity
- Operating Supply Voltage Range : $V_{CC}=7\sim 17V$
- Hall Sensor Input : $V_H=30mVp-p$
- Protect Diodes equipped for all inputs
- Built-in Internal Reference
- Built-in Thermal shut down circuit

Weight : 0.50g(Typ.)

MAXIMUM RATINGS ($T_a=25^\circ C$)

* Note: V_{CC} shall be impressed while hall sensor signal is applied to input.
Otherwise through current will flow.

1. CONTROL INPUT CIRCUIT

V_{RF} ($=R_F \cdot I_L$) of feed back voltage is feed backed to negative input of control amplifier internally.

(Note)

2 terminals (③, ⑬ pins) are provided for R_F terminal to decrease the interference caused by internal common impedance.

INPUT-OUTPUT CHARACTERISTIC

Gain $\neq$ Double

R_L : Output Coil Resistance

$V_{CE(sat)}$: Output Saturation Voltage
(Upper and Lower Side Total)

APPLICATION CIRCUIT

Note 1) Recommendable value of RF is 0.3 to 5Ω. It depends on required initial torque, gain, coil impedance and control voltage of Pin 5.

Note 2) To connect directly to IC Pin and GND to eliminate the influence of common impedance. It is required to increase the value of this capacitance for stable operations in case of poor wiring or patterning of PCB.

Note 3) Special care should be taken not to have a common impedance with GND line,
RF GND and Hall Sensor GND line.

Note 4) Please select to optimum value for eliminate a virbration noise and parasitic oscillation.

Note 5) Hall signal input min 30mVp-p. The signal smaller than this can cause through current.

OUTPUT AMP. SATURATION VOLTAGE CHARACTERISTICS

TA8473F

TENTATIVE DATA

FAN MOTOR DRIVER IC

The TA8473F is a fan motor driver IC.

The output current is 0.4A (AVE) and all functions needed for fan motor driving have been incorporated into 1 chip.

This IC is provided with the function to automatically change the motor speed by detecting ambient temperature through the externally mounted thermistor. Furthermore, the TA8473F is provided with the noise reduction terminal, the FG terminal to output pulses proportional to the motor speed and the RD terminal to detect the motor status.

Weight : 0.14g(Typ.)

- Built-in automatic self rotation recovery circuit after release of motor locking.
- Thermal shutdown circuit incorporated.
- Operating voltage : 6~13.8V
- 2 kind of speed of full-speed and half-speed are variable according to ambient temperature.
- Speed change point temperature is externally settable.

MAXIMUM RATINGS (Ta=25°C)

CHARACTERISTIC		SYMBOL	RATING	UNIT

TA8529F

STEPPING MOTOR DRIVER

TA8529F is Bipolar Stepping Motor Driver IC designed especially for low operating voltage use FDD and other portable equipments.

- . Bipolar Stepping Motor Driver
- . Low Saturation Voltage Type
 - Saturation Voltage ≤ 0.95 V at $I_O=400$ mA
- . 1,2 and 1-2 Phase Excitation Dtive Available
- . Stand-by Mode Available
 - I_{CC} Stand-by $\leq 15\mu$ A
- . Built-in Punch Through Current Restriction Circuit
- . Output Current Up to 500mA (PEAK)
- . Sealed in PFP 20 SM Package

Weight : 0.79g (Typ.)

TB6500AH

TENTATIVE DATA

STEPPING MOTOR SYSTEM DRIVER

TB6500AH is Stepping Motor System Driver IC incorporates Dual Bipolar Stepping Motor Drivers, DC Motor Driver and Serial to Parallel Signal Conversion Circuit (12 bit Serial to Parallel Shift Resistor with Latch) which control the 3 Output Drivers states by means of Input Serial Signal trains.

- 2 Bipolar Stepping Motors and 1 Brush DC Motor (or Solenoid) are controlled by input serial signal trains and latch signals.
- Output Current up to 0.8A (for Stepper) and 0.6A (for DC Motor).
- PWM Chopper type Stepping Motor Drivers.
- All C-MOS Compatible Inputs.
- Operating Supply Voltage : $V_M=0\sim 27V$

$$V_{CC}=4.5\sim 5.5V$$

Weight : 9.9g (Typ.)

∞ : High Impedance

INPUT STAGE (CK, S-IN, STROBE)

OSC STAGE (OSC)

$$f_{OSC} = \frac{1}{21.4 \cdot C_{OSC}} \text{ (kHz)}$$

APPLICATION CIRCUIT

Note. Care should be taken not to have a common impedance with Output Current pass of each Motor (NF A, NF B for Motor 1, NF C, NF D for Motor 2 and PG for DC Motor) and any other signal lines.

And recommend to take One Point GND with each Output Current pass and corresponding PG terminal. (See Table 1 of Block Diagram)

TB6504F

PWM CHOPPER TYPE BIPOLAR STEPPING MOTOR DRIVER

TB6504F is PWM chopper type sinusoidal micro step bipolar stepping motor driver. Sinusoidal micro step operation is accomplished only a clock signal inputting by means of built-in hardware.

- 1 chip bipolar sinusoidal micro step stepping motor driver.
- Output current up to 150mA
- PWM chopper type.
- Structured by high voltage Bi-CMOS process technology.
- Forward and reverse rotation are available.
- 2, 1-2, W1-2, 2W1-2, phase 1 or 2 clock drives are selectable.
- Package:SSOP24-P-300
- Input Pull-up Resistor equipped with RESET and ENABLE Terminal: $R=200k\Omega$ (Typ.)
- Output Monitor available with $\overline{MO}$. $I(\overline{MO})=\pm 2mA$ MAX.
- Reset and Enable are available with $\overline{RESET}$ and $\overline{ENABLE}$.

Weight : 0.32g (Typ.)

AC ELECTRICAL CHARACTERISTIC

. CK(OSC)-OUT

OUTPUT CIRCUIT

INPUT CIRCUIT

- CK1, CK2, CW/CCW, M1, M2, REF IN : Terminals

- $\overline{\text{RESET}}$, $\overline{\text{ENABLE}}$: Terminal

- OSC : Terminal

$$V_A = (V_{CC} - V_{BE}) \frac{R_3}{R_3 + R_4} \doteq 2.15V$$

OSC FREQUENCY CALCULATION

Sawtooth OSC circuit consists of Q1 through Q4 and R1 through R4.

Q2 is turned "off" when V_{OSC} is less than the voltage of $2.5V + V_{BE}$ Q2 approximately equal to 2.85V.

V_{OSC} is increased by C_{OSC} charging through R1.

Q3 and Q4 are turned "on" when V_{OSC} becomes 2.85V(Higher level.)

Lower level of V 22 pin is equal to V_{BE} Q2 + V_{SAT} Q4 approximately equal to 1.4V.

V_{OSC} is calculated by following equation.

$$V_{OSC} = 5 \cdot (1 - e^{-\frac{1}{C_{OSC} \cdot R1} t})$$

Assuming that $V_{OSC} = 1.4V$ ($t = t1$) and $= 2.85V$ ($t = t2$)

C_{OSC} is external capacitance connected to pin 22 and R1 is on-chip $10k\Omega$ resistor.

Therefore, OSC frequency is calculated as follows.

$$t1 = -C_{OSC} \cdot R1 \cdot \ln \left(1 - \frac{1.4}{5} \right)$$

$$t2 = -C_{OSC} \cdot R1 \cdot \ln \left(1 - \frac{2.85}{5} \right)$$

$$f_{OSC} = \frac{1}{t2 - t1} = \frac{1}{C_{OSC} (R1 \cdot \ln \left(1 - \frac{1.4}{5} \right) - R1 \cdot \ln \left(1 - \frac{2.85}{5} \right))}$$

$$\approx \frac{1}{5.15 \cdot C_{OSC}} \text{ (kHz) } (C_{OSC} : \mu F)$$

Note 1. Schottky diode(U1GWJ49) to be connected additionally between each output (pin 16/13/12/9) and GND for preventing Punch-through Current.

Note 2. GND pattern to be laid out at one point in order to prevent common impedance.

Note 3. Capacitor for noise suppression to be connected between the Power Supply(VCC,VM) and GND to stabilize the operation.

EXCITATION

2 Phase Excitation (M1:L, M2:L, CW Mode)

1-2 Phase Excitation (M1:H, M2:L, CW Mode)

2W1-2 Phase Excitation (M1:H, M2:H, CW Mode)

$\overline{\text{ENABLE}}$ AND $\overline{\text{RESET}}$ FUNCTION AND $\overline{\text{MO}}$ SIGNAL

$\overline{\text{ENABLE}}$ Signal disables only Output Signal.

Internal logic functions are proceeded by CK signal without regard to $\overline{\text{ENABLE}}$ signal. Therefore, Output Current is initiated from the proceeded timing point of internal logic circuit after release of disable mode.

Fig.1 shows the $\overline{\text{ENABLE}}$ functions, when the system is selected in 1-2 Phase drive mode.

Fig.1 1-2 Phase drive mode (M1:H, M2:L)

As $\overline{\text{RESET}}$ is low, the decoder is initialized and $\overline{\text{M0}}$ is low.

After $\overline{\text{RESET}}$ is high, the motion is resumed from next clock as shown in Fig.2.

Fig. 2 1-2 Phase drive mode (M1:H, M2:L)

$\overline{\text{M0}}$ (Monitor Output) Signals is used as rotation and initial signal for stable rotation checking.

TC9142AP

QUARTZ PLL MOTOR CONTROL

The TC9142AP is a C²MOS LSI developed for controlling the motor of a quartz-lock D.D. record player. Since an 8-bit D/A converter system has been employed for each of the speed control system (AFC) and the phase control system (APC), a wide reduction of external parts can be made in comparison with conventional capacitor-type S/H systems, thus having realized adjustment free operation.

- Has built-in AFC and APC, for each of which 8-bit D/A converter system has been employed.
- Speed-changeover positions are available at 33 1/3 and 45-rpm.
- Crystal can be used up to 12MHz, and crystal reference dividing frequency is selectable from three positions of 1/4, 1/32 and 1/128 to increase the degree of freedom in the number of FC pulses of motor or crystal frequency, which allows a wide range of design to be made.
- External oscillator makes possible fine adjustment of speed.
- Provided with strobe reference output and reverse signal output.

11	P/S	PLAY/STOP Input Terminal	Motor PLAY/STOP signal input terminal L=PLAY, H or NC=STOP	With a built-in pull-up resistor.
14	CPIN	Reference Frequency Input Terminal	Normally connected to CPOUT. For external fine adjustment input from an external oscillator.	
15	CPOUT	Reference Frequency Output Terminal	Terminal for divided output from the crystal reference frequency divider. Normally connected to CPIN.	
13	STROBE	Strobe Output Terminal	Reference frequency output terminal for strobe. Duty is 1/8.	
12	LD	Lock Detecting Terminal	This terminal becomes H when the motor speed is within the lock range and otherwise L.	
8	AFC	AFC Output Terminal	Output terminal for motor speed control system. Output of 8 bit D/A converter.	
7	APC	APC Output Terminal	Output terminal for motor phase control system. Output of 8 bit D/A converter.	
9	RV	Reverse Signal Output Terminal	Terminal for motor reverse signal output.	
4 5	N1 N2	Reference Divided Frequency Switching Terminal	Switching of divided frequency from the crystal reference frequency divider into 1/4, 1/32 and 1/128 is possible.	With a built-in pull-up resistor.

EXPLANATION OF OPERATION

(1) Crystal oscillation terminals (X_T , $\overline{X_T}$)

- The crystal oscillator is used by connecting as shown below.

* C_L OF 10~30pF is appropriate.

Crystal oscillation frequency is calculated by the following equation according to number of FG pulses of a motor to be used.

$$f_X = 3/4FG' \times 128 \times 20 \times N = 5/9FG' \times 128 \times 27 \times N = 1920FG' \cdot N \quad (\text{Hz})$$

(Note) $3/4FG'$: FG_{IN} frequency at 45rpm.

$5/9FG'$: FG_{IN} frequency at $33\frac{1}{3}$ rpm.

Further, f_X : Crystal oscillation frequency, FG' : No. of FG pulses generated per revolution of motor.

N : Ratio of frequency division of the crystal reference frequency divider.

(Refer to Item (10).)

- Maximum operating frequency is above 12MHz and crystals up to 12MHz can be used.

(2) Reference frequency input/output terminals (CP_{OUT} , CP_{IN})

- Divided output $\frac{f_X}{N}$ from the crystal reference frequency divider is available at CP_{OUT} , which is normally connected to CP_{IN} .
- When an external oscillator (CR oscillator, etc.) is connected to CP_{IN} , motor speed can be finally adjusted.

(3) Strobe reference frequency output terminal (STROBE)

- This is the reference output terminal for strobe and $\frac{1}{32 \times (20 \text{ or } 27) \times 128}$ of crystal oscillation frequency is available at this terminal.
- Duty is 1/8 and suited to a single stripe strobe.

(4) FG pulse input terminal (FGIN)

- This is the input terminal of FG pulse that shows the motor speed. This FG pulse becomes comparison frequency.
- This terminal has built-in Amplifier and Schmitt circuit. FG pulses are applied through capacitor coupling and small amplitude is enough for proper operation.

(5) Speed switching terminal (33/45)

- This terminal is for switching the motor speed $33\frac{1}{3}$ rpm, and 45 rpm, with a pull-up resistor and chattering preventive circuit.

(TRUTH TABLE)

33/45	DIVIDED FREQUENCY	SPEED
L	$\frac{1}{27}$	$33\frac{1}{3}$ rpm.
H or NC	$\frac{1}{20}$	45 rpm.

(6) APC, AFC output terminal (APC, AFC)

- AFC (speed control output) is a F-V converter for FG frequency, and is consisting of a 8 bit D/A converter.
- APC (phase control output) is a phase comparator (ϕ -V converter) that compares phase difference ϕ between 1/2 FG and reference frequency FS', and is also consisting of a 8 bit D/A converter.
- Both APC and AFC perform the following 3 operations according to FGIN frequency.

a. When FGIN frequency is within the lock range:

Both APC and AFC perform the normal operation for FGIN.

Further, the Lock range is,

$$\left\{ \begin{array}{l} \text{at } 45\text{rpm} \dots \text{Reference cycle } \frac{1}{FS} \left\{ \begin{array}{l} +4.6\% \\ -5.3\% \end{array} \right. \\ \text{at } 33\frac{1}{3}\text{ rpm} \dots \text{Reference cycle } \frac{1}{FS} \left\{ \begin{array}{l} +3.4\% \\ -3.9\% \end{array} \right. \end{array} \right.$$

(Note)

$$\text{Reference frequency } FS = \frac{f_X}{N(20 \text{ or } 27) 128} \text{ (Hz)}, FS' = \frac{1}{2} FS$$

b. When FGIN frequency is below the lock range (under speed):

APC and AFC outputs are both fixed at "H" level.

c. When FGIN frequency is above the lock range (over speed):

APC and AFC outputs are both fixed at "L" level.

• When a motor is in STOP state (P/S=H or NC), both AFC and APC are fixed "L" level.

AFC Output change status for FGIN frequency

APC Output change status for phase difference ϕ .

- AFC and APC timing chart within lock range.

a. AFC (SPEED CONTROL SYSTEM)

b. APC (PHASE CONTROL SYSTEM)

(7) Lock detecting terminal (LD)

- This terminal is the lock detecting output and is placed at "H" level when FG_{IN} frequency is within the lock range and otherwise, placed at "L" level.

(8) PLAY/STOP input terminal (P/S)

- PLAY/STOP signals of the motor are input to this terminal.

PLAY=L, STOP=H or NC.

- This terminal has a pull-up resistor and a chattering preventive circuit.
- During PLAY (P/S=L), AFC, APC and LD perform the above-mentioned operations for FG_{IN} frequency, and during STOP (P/S=H or NC), AFC, APC and LD are all fixed at "L" level.

(9) Reverse signal output terminal (RV)

- Reverse signal for braking the motor at time of switching of motor speed from 45rpm to $33\frac{1}{3}$ rpm or the operation from PLAY to STOP is output through this terminal.
- Change of RV output status

PREVIOUS STATUS	RV OUTPUT CHANGE TO "H" LEVEL	RV OUTPUT CHANGE TO "L" LEVEL
During normal rotation (during lock) at 45rpm	When the motor speed is switched from 45rpm to $33\frac{1}{3}$ rpm	When the motor speed is locked at $33\frac{1}{3}$ rpm, or when $FG_{IN} \leq 1/8FS$, or when the motor speed is switched from $33\frac{1}{3}$ rpm to 45rpm.
During normal rotation (during lock) at $33\frac{1}{3}$ rpm or 45 rpm.	When the operation is switched from PLAY to STOP.	When $FG_{IN} \leq 1/8FS$ or when the operation is switched from STOP to PLAY.

- In other cases than above, RV output is not changed and fixed at "L" level.
- Further, if FG frequency rises up to 1.5 times of normal rotation at 45rpm. (2 times of normal rotation at 33rpm), RV output is reset.

(10) Reference divided frequency switching terminal (N1, N2)

- Divided frequency 1/N of the crystal reference frequency divider can be switched to 1/4, 1/32 or 1/128 by number of FG pulses or a crystal used.
- This terminal has a built-in pull-up resistor.

(TRUTH TABLE)

CHARACTERISTIC DATA

EXAMPLE APPLICATION CIRCUIT

• Example of crystal oscillation frequency calculation

When FG' (number of FG pulse)=90 pulses, if the dividing frequency of reference divider is set at N=32 dividing frequency, the crystal oscillation frequency f_X is as follows:

$$f_X = 1920 \cdot FG' \cdot N = 1920 \times 90 \times 32 = 5,5296\text{MHz}$$

CAUTION IN APPLICATION

- . APC and AFC terminals are for the 8-bit D/A converter outputs, which are directly output from the R-2R ladder type resistor network as shown in the following diagram. Impedance of these outputs becomes equal to the ladder resistor value R_L . Therefore, input impedance at the receiving side of these terminals shall be designed accordingly.

- . A filter for an externally mounted differential amplifier on an application circuit shall be selected to meet the response characteristic of a motor to be used.

TC9192AP/AF

DOUBLE PLL FOR MOTOR CONTROL

This is a LSI designed for motor-controlling the copying machine of which motor-rotation speed is necessary to be varied freely. With built-in PLL and VCO for reference signal generation, reference frequency can voluntarily be varied externally.

- Through using built-in VCO, PD, phase comparator and divider reference frequencies can be obtained.
- AFC and APC applied with 8-bit D/A converter system is incorporated, and transistor of bipolar type is provided at the output for Buffer Amplifier.
- Lock range can be switched.
- $1/2 V_{DD}$ output for filter-amplifier is provided.
- Lock detection output and reverse rotation signal output are provided.

17	DO	Output terminal of phase comparator	C-MOS output
4	Test	Input terminal of internal test. Generally ground.	C-MOS input

EXPLANATION OF OPERATION

TC9192AP has double PLL which is consist of AFC/APC loop for motor-controlling and phase feedback loop for reference signal. In the following operation of respective block is explained.

1. Phase Feedback Loop

(1) Voltage controlled oscillator terminal (C,EL,RH,VC)

- . Voltage controlled oscillator (VCO) is consist of the Nch open drain FET (VC,RH terminal) and current controlled oscillator (RL,C terminal) combined. VCO is an oscillator of which oscillation frequency is controlled by given control voltage. The control voltage and oscillation frequency are proportional.
- . The operation frequency range of VCO is 0.5~2.5MHz.
- . Frequency which is obtained by VCO becomes control signal (CP) of AFC, APC loop in next step.

(2) Phase comparator output terminal (F_{sig} , F_{ref} , DO)

- . Phase comparator detects the input pulse difference, and outputs at DO the positive and the negative pulses proportioned with the phase difference.

PHASE COMPARATOR TIMING CHART

- . F_{ref} terminal is reference signal input terminal of APC/AFC loop control signal (CP), the motor speed (the number of FG pulses of motor) is decided by it.

The relations between FG, F_{ref} and FG are as follows;

$$f_x(CP) = 2560 \times F_{ref}[Hz] : \text{Relation between } F_{ref} \text{ and control signal (CP)}$$

$$f_x(CP) = 20 \times 128 \times FG[Hz] : \text{Relation between FG and control signal (CP)}$$

∴ This relation becomes " $FG = F_{ref}[Hz]$ "

- . F_{ref} input terminal is a C-MOS structure.
- . F_{sig} output terminal is put out comparison signal of phase comparator.

2. APC/AFC Loop

(1) FG pulse input terminal (FG_{IN})

- . This is the input terminal of FG pulse for indicating the motor speed, and this signal becomes the comparison frequency of internal PLL.
- . Since the amplifier and the Schmitt circuit are incorporated, operation is made with the small amplitude through the coupling capacitor.

(2) Output terminals (APC, AFC) of phase control system (APC) and speed control system.

- . AFC is F-V converter against FG_{IN} frequency and is fabricated with 8-bit D/A converter.
- . APC is the phase comparator (ϕ -V converter) for comparing the phase difference ϕ between $\frac{1}{2}FG$ signal and the reference signal FS' , and is also fabricated with 8-bit D/A converter.

(Note) $FS' = \frac{1}{2}FS$

- . Both APC and AFC perform three kinds of operations described below.
 - a) When FG_{IN} frequency is within the lock range, both APC and AFC perform the normal operation against FG_{IN} .

Against the reference synchronization FS, the lock range is

at LW="L", +9.3%, -10.6% (about $\pm 10\%$)

at LW="H", +4.6%, -5.3% (about $\pm 5\%$)

(Note) Reference frequency $FS = \frac{f_{VCO}}{20 \times 128}$ [Hz]

- b) When FG_{IN} frequency is under the lock range (under speed), the outputs of APC and AFC are fixed at "H" level.
- c) When FG_{IN} frequency is over the lock range (over speed), the outputs of APC and AFC are fixed at "L" level.
- . When the motor is in STOP state (RIS=H or Open), both the outputs of AFC and APC are fixed at "L" level.
- . Bipolar transformer is incorporated at the output stage of both APC and AFC.

CHANGE OF APC OUTPUT
AGAINST FG_{IN} FREQUENCY

CHANGE OF APC OUTPUT
AGAINST PHASE DIFFERENCE ϕ

• Timing charts of AFC and APC within lock range

a. AFC (speed control system)

(3) Output terminal for reference voltage generation (V_{ro})

- V_{ro} is the transistor output terminal for the reference voltage of the operational amplifier which controls the motor by means of synthesizing the outputs of APC and AFC.
- V_{ro} is fixed at $\frac{1}{2} V_{DD}$ internally through dividing the resistance, and the output is fabricated into bipolar transistor construction.

(4) Lock range switching input terminal (LW)

- This is the terminal for switching the lock range of APC and AFC, and two kinds of lock ranges can be selected through operating this terminal.
 - at LW="H", normal lock range ($\pm 5\%$)
 - at LW="L", double lock range ($\pm 10\%$)

(5) RUN/STOP input terminal (RIS)

- . RUN/STOP signals of motor are input. RUN="L", STOP="H" or open.
- . During RUN(RIS=L), APC, AFC and LD perform the normal operation against FGIN frequency. During STOP(RIS=H or Open), APC, AFC and LD are all fixed at "L" level.
- . Pull-up resistance and chattering prevention circuit are incorporated.

(6) Lock detection terminal (LD)

This is the output terminal for lock detection. When FGIN frequency is within lock range, the terminal is at "H" level, and in other cases, at "L" level.

(7) Reverse rotation signal output terminal (RV)

- . RV is the reverse rotation signal output for applying the brake to the motor when the motor is changed to STOP state.
- . When STOP state is turned out, RV becomes "H" level, and when the frequency of FGIN becomes below $\frac{1}{2}$ FS, "L" level. In other cases, RV is fixed at "L" level.

CHARACTERISTIC TEST CIRCUIT

EXAMPLE OF APPLICATION CIRCUIT

TC9193AF

MOTOR CONTROL PLL FOR DISK DRIVE

This is a C²MOS LSI designed for motor control of the floppy disk driver (FDD) and the winchester disk driver.

3-bit D/A convertor method is adopted for the speed control system (AFC) and the phase control system (APC) to make the remarkable reduction of the external part quantity and the complete freedom from the maintenance realized.

- Bipolar type transistors are provided to the outputs of AFC and APC.
- Sector detection signal generating circuit synchronized to index pulse is incorporated enabling the number of sectors changed over from outside.
- The number of X'tal reference dividing can be switched to $\frac{1}{2}$ and $\frac{1}{4}$
- The terminals for sector signal output, lock detection output and reverse rotation signal output are provided.
- Package is MFP of 20-pin.

Weight : 0.48g(Typ.)

17	IPout	Index pulse is output synchronously with sector detection signal.	C-MOS output
18	CPin	Reference frequency input terminal for internal control, which is usually connected to CPout.	C-MOS input
19	CPout	Output terminal of crystal reference divider, which is usually connected to CPIN.	C-MOS output
4	TEST	Input terminal for internal test, which is usually connected with ground.	C-MOS input

OPERATIONAL DESCRIPTION

1) Crystal Oscillating Terminal (XT, $\overline{XT}$)

- The crystal oscillator is connected to be used as shown in the following figure.

* The value of 10~30pF is appropriate for CL.

- The crystal oscillation frequency is calculated through the following formula according to the number of pulses of the motor to be used.

$$f_X = \frac{1}{4} FG' \times 128 \times 19 \times N = 608 FG' \times N \quad [\text{Hz}]$$

f_X : Number of crystal oscillation frequency.

FG' : Frequency to be input to FGin.

N : Dividing ratio of reference divider. [2] or [4].

2) Reference Frequency Input-Output Terminal (CPout, CPin)

- The dividing output $\frac{f_X}{N}$ of the reference divider is output to CPout which is usually connected to CPin.
- The motor speed can finely be adjusted through connecting the external oscillator (CR oscillator, etc.) with CPin.

3) Changeover Terminal of Reference Frequency (2/4)

- The dividing number $\frac{1}{N}$ of the reference divider can be changed over to $\frac{1}{2}$ or $\frac{1}{4}$ by the number of FG pulses and the oscillation frequency to be used.
(With pull-up resistance)

$$\text{at } 2/4 = "L", N = \frac{1}{2}$$

$$\text{at } 2/4 = "H", N = \frac{1}{4}$$

4) FG Pulse Input Terminal (FGin)

- . FG pulse input indicating the r.p.m. of motor, of which signal becomes the comparative frequency of the internal PLL.
 - . Since the AMP and the schmitt circuit are incorporated, operation is made in small amplitude with C-connection.
 - . Since the $\frac{1}{4}$ divider is internally provided, care must be taken at calculating the reference frequency.
- 5) Output Terminals (APC and AFC) of Phase Control System (APC) and Speed Control System (AFC)
- . AFC is an F-V converter for FGin frequency and is composed of an 8-bit D/A converter.
 - . APC is a phase comparator (ϕ -V converter) for detecting the phase-difference ϕ between $\frac{1}{2}$ FG signal and the reference frequency FS', and is also composed of an 8-bit D/A converter.
 - . Both APC and AFC carry out the three kinds of operations described below according to FGin signal.
 - a. When FGin frequency is within the lock range, both APC and AFC carry out the regular operation for FGin.
The lock range is +4.9% to -5.6% of the reference frequency FS.
- (Note) Reference frequency = $\frac{f_X}{N \times 19 \times 128}$ [Hz]
- b. In case FGin frequency is under the lock range (under speed), APC and AFC outputs are fixed at "H" level.
 - c. In case FGin frequency is over the lock range (over speed), APC and AFC outputs are fixed at "L" level.
 - . When the motor is in the stop state (R/S=H or Open), AFC and APC outputs are fixed at "L" level.
 - . Both APC and AFC have the bipolar transistors incorporated in the output stage.

Changing pattern of AFC output
against FG_{in} frequency

Changing pattern of APC output
phase difference ϕ

. Timing charts of AFC and APC within lock range

a. AFC (speed control system)

b. APC (phase control system)

- 6) Input/output Terminal for Generating Reference Voltage (VR_{out}, VR_{in})
VR_{out} (VR_{in}) is a transistor output (input) terminal for the reference voltage of the operational amplifier which controls the motor through making the APC (AFC) output synthesized.
- 7) RUN/STOP input terminal (R/S)
 - . RUN/STOP signal of the motor is input.
RUN="L", STOP="H" or OPEN
 - . During RUN (R/S=:), APC, AFC and LD perform the regular operation against FG_{in} frequency and during STOP (R/S=H or OPEN), APC, AFC and LD are fixed at "L" level.
 - . Pull-up resistance and chattering prevention circuit are incorporated.
- 8) Lock Detection Terminal (LD)
This is an output terminal for lock detection, which goes into the state of "H" level when FG_{in} frequency is within the lock range, and into "L" level in the other cases.
- 9) Reverse Signal Output Terminal (RV)
 - . This is a reverse signal output terminal for applying the brake to the motor when the locked RUN state is changed over to the STOP state (R/S=H or OPEN).
 - . RV goes into the state of "L" level when changed over to STOP state, and goes into "L" level when the frequency of FG_{in} becomes $\frac{1}{2}f_s$ or under. In the cases other than the above, this is fixed at "L" level.
- 10) Changeover Terminal of Number of Sectors (17/32)
This is an input terminal for changing over the number of sectors per track of the disk. The number of sectors are 17 and 32.
 - At 17/32="L", the number of sectors is 17.
 - At 17/32="H", the number of sectors is 32.

11) Sector Detection Signal Output Terminal (STROBO)

- . This is a signal output terminal for detecting the sector of which output is as follows.

$$f_{STRB} = \frac{f_X}{N \times (17 \text{ or } 32) \times 76} \quad [\text{Hz}]$$

f_{STRB} = Sector detection frequency

N : Dividing ratio of reference divider

f_X : Crystal oscillation frequency

- . Duty is 3/76.

12) Index Pulse Input Terminal (IPin)

- . This is a terminal for inputting the index pulse fetched from the motor.
- . Pull-up resistance is incorporated.

13) Index Pulse Output Terminal (IPout)

This is a terminal for outputting the index pulse, which is input to IPin, after making the index pulse synchronized with the interval sector detection signal.

The relation between the index pulse and the sector detection signal (STROBO) is as shown below.

TC9203AP/AF

PLL MOTOR CONTROL FOR FDD

TC9203AP/AF are CMOS LSI designed for controlling the motor of especially for Disk Spindle Drive (FDD). 8-bit D/A converter system has been employed for each of the speed control system (AFC) and the phase control system (APC) and realize a wide reduction of external parts and free adjustment motor control system.

- Crystal can be used up to 8MHz, and crystal reference dividing frequency selected from three position of 1/5, 1/6 and 1/12 correspond to 8,5 and 3.5 inch FDD.
- Lock range can be selected from two position of 1/20 and 1/27.
- External oscillator makes possible fine adjustment of speed.
- Lock detection output and reverse rotation signal output are provided.
- Surface mount is available with TC9203AF.

Unit in mm

Weight TC9203AP : 1.00g (Typ.)
TC9203AF : 0.16g (Typ.)

FUNCTION EXPLANATION OF EACH TERMINAL

PIN No.	SYMBOL	TERMINAL NAME	FUNCTIONAL & OPERATION EXPLANATION	REMARKS
16	VDD		Power supply voltage terminal and grounding terminal.	
1	GND			
2	$\overline{X_T}$	Crystal Oscillation Terminal	Crystal oscillator is connected.	With a built-in feedback resistor.
3	X _T			
4	N1	Reference Divided Frequency Switching Terminal	Switching of divided frequency from the crystal reference frequency divider into 1/5, 1/6 and 1/12 is possible.	With a built-in pull-up resistor.
5	N2			
6	FGIN	FG Pulse Input Terminal	Frequency generator input.	With a built-in amplifier.
7	APC	APC Output Terminal	8 bit DAC output terminal for phase-voltage conversion.	
8	AFC	AFC Output Terminal	8 bit DAC output terminal for frequency-voltage conversion.	
9	RV	Reverse Signal Output Terminal	Terminal for motor reverse signal output.	
10	20/27	Lock Range Switching Terminal	Terminal for switching lock range. H of NC=1/20, L=1/27.	With a built-in pull-up resistor.
11	R/S	RUN/STOP Input Terminal	Motor RUN/STOP signal input terminal. H or NC=STOP, L=RUN.	With a built-in pull-up resistor.
12	LD	Lock Detecting Terminal	This terminal becomes H when the motor speed is within the lock range and otherwise L.	
14	CPIN	Reference Frequency Input Terminal	Normally connected to CPOUT. For external fine adjustment input from an external oscillator.	
15	CPOUT	Reference Frequency Output Terminal	Terminal for divided output from the crystal reference frequency divider. Normally connected CPIN.	
13	TEST	Test Terminal	Input terminal of internal test. Generally ground.	

OPERATION

1. Crystal oscillation terminals (X_T , $\overline{X_T}$)

- The crystal oscillator is used by connecting as shown below.

. C_L of 10~30pF is appropriate.

- Crystal oscillation frequency is calculated by the following equation according to number of FG pulses of a motor to be used.

$$f_X = \frac{R}{60} \times FG' \times 128 \times (20 \text{ or } 27) \times N \quad (\text{Hz})$$

(Note) (20 or 27) : 20 at 20/27="H" or Open.
27 at 20/27="L".

f_X : Crystal oscillation frequency, FG' : number of FG pulse generated per revolution of motor, R : revolution of motor per minute, N : Ratio of frequency division of the crystal reference frequency divider. (Refer to Item 9.)

- Maximum operating frequency is above 8MHz and crystals up to 8MHz can be used.

2. Reference frequency input/output terminals (CPIN, CPOUT)

- Divided output $\frac{f_X}{N}$ from the crystal reference frequency divider is available at CPOUT, which is normally connected CPIN.
- When an external oscillator (CR oscillator, etc.) is connected to CPIN, motor speed can be finally adjusted.

3. FG pulse input terminal (FG_{IN})

- . This is the input terminal of FG pulse that shows the motor speed.
This FG pulse becomes **comparison frequency**.
- . This terminal has built-in Amplifier and Schmitt circuit.
FG pulses are applied through capacitor coupling and small amplitude is enough for proper operation.

4. Lock range switching terminal (20/27)

- . This terminal is for switching lock range of motor, with a pull-up resistor and chattering preventive circuit.

(TRUTH TABLE)

20/27	DIVIDED FREQUENCY	LOCK RANGE
L	1/27	+3.4 ~ -3.9% of reference cycle
H or NC	1/20	+4.6 ~ -5.3% of reference cycle

5. APC, AFC output terminal (APC, AFC)

- . AFC (speed control output) is a F-V converter for FG frequency, and is consisting of a 8 bit D/A converter.
- . APC (phase control output) is a phase comparator (ϕ -V converter) that compares phase difference ϕ between 1/2 FG and reference frequency FS', and is also consisting of a 8 bit D/A converter.
- . Both APC and AFC perform the following 3 operations according to FG_{IN} frequency.
 - a. When FG_{IN} frequency is within the lock range:
Both APC and AFC perform the normal operation for FG_{IN}.
 - b. When FG_{IN} frequency is below the lock range (under speed):
APC and AFC outputs are both fixed at "H" level.
 - c. When FG_{IN} frequency is above the lock range (over speed):
APC and AFC outputs are both fixed at "L" level.
- . When a motor is in STOP state (P/S=H or NC), both AFC and APC are fixed "L" level.

AFC Output change status for FGIN frequency

APC Output change status for phase difference ϕ .

. AFC and APC timing chart within lock range.

a. AFC (SPEED CONTROL SYSTEM)

b. APC (PHASE CONTROL SYSTEM)

6. Lock detecting terminal (LD)

- . This terminal is the lock detecting output and is placed at "H" level when FG_{IN} frequency is within the lock range and otherwise, placed at "L" level.

7. RUN/STOP input terminal (R/S)

- . RUN/STOP signals of the motor are input to this terminal.
- . This terminal has a pull-up resistor and a chattering preventive circuit.
- . During RUN (R/S=L), AFC , APC and LD perform the above-mentioned operations for FG_{IN} frequency, and during STOP (R/S=H or NC), AFC, APC and LD are all fixed at "L" level.

8. Reverse signal output terminal (RV)

- . At the switching of lock range from 1/20 to 1/27 or the operating from RUN to STOP, reverse signal for braking the motor is output through this terminal.
- . Change of RV output status

PREVIOUS STATUS	RV OUTPUT CHANGE TO "H" LEVEL	RV OUTPUT CHANGE TO "L" LEVEL
During normal rotation (during lock) at 1/20.	When the lock range is switched from 1/20 to 1/27.	When the motor speed is locked at 1/27, or when FG _{IN} 1/8FS, or when the lock range is switched from 1/27 to 1/20.
During normal rotation (during lock) at 1/20 or 1/27.	When the operation is switched from RUN to STOP.	When FG _{IN} 1/8FS or when the operation is switched from STOP to RUN.

- . In other cases than above, RV output is not changed and fixed at "L" level.
- . Further, if FG frequency rises up to 1.5 times of normal rotation at 1/20 (20 times of normal rotation at 1/27), RV output is reset.

9. Reference divided frequency switching terminal (N1, N2)

- . Divided frequency 1/N of the crystal reference frequency divider can be switched to 1/5, 1/6 or 1/12 by number of FG pulses or a crystal used.

- . This terminal has a built-in pull-up resistor.

(TRUTH TABLE)

N1	N2	1/N
H	H	1/5
L	H	1/6
H	L	1/12

1/N: CRYSTAL REFERENCE DIVIDED FREQUENCY

(Note) Don't use mode, N1=N2="L", because this mode is test mode.

CAUTION IN APPLICATION

- . APC and AFC terminals are for the 8-bit D/A converter outputs, which are directly output from the R-2R ladder type resistor network as shown in the following diagram. Impedance of these outputs becomes equal to the ladder resistor value R_L . Therefore, input impedance at the receiving side of these terminals shall be designed accordingly.

- . A filter for an externally counted differential amplifier on an application circuit shall be selected to meet the response characteristic of a motor to be used.

CHARACTERISTIC TEST CIRCUIT

- (1) Operating supply current I_{DD}

- (2) X_T Operating frequency range $f_{MAX}(f_{XT})$

- (3) CPIN Operating frequency range
 $f_{MAX}(f_{CP})$

- (4) FG_{IN} Input sensitivity V_{INFG}

- (5) Amplifier feedback resistor

- (6) D/A Converter ladder resistor $\overline{R_L}$

CHARACTERISTIC DATA

EXAMPLE APPLICATION CIRCUIT

Example of crystal oscillation frequency calculation.

When FG' (number of FG pulse)=180 pulses and R (revolution of motor)=200r.p.m., if the dividing frequency of reference divider and lock range is set at N=5 dividing frequency and 20/27=20, the crystal oscillation frequency f_X is as follows:

$$f_X = \frac{R}{60} \times FG' \times 128 \times N = \frac{200}{60} \times 180 \times 128 \times 20 \times 5 = 7.680 \text{ MHz}$$

TD6303F

FOR SERVO MOTOR CONTROL

TD6303F is designed for small motor speed control. This is designed specially for low voltage and low current operation, and is suitable for FG servo control of small DC motor for portable equipment.

- Installed in a very small flat package
- Can operate with low voltage
-Operating voltage : $V_{CC}=1.8\sim6V$
- Can operate at two speed levels
(Example : 2.4cm/s and 1.2cm/s for micro cassette tape recorder)
- Can hold stand-by operation with very small current
(i.e, $2\mu A$ nominal), being provided with stand-by switch.
- Can be applicable to remote control and others.

Weight : 0.16g(Typ.)

FUNCTIONAL EXPLANATION OF TERMINALS

PIN No.	SYMBOL	TERMINAL NAME	FUNCTION
1	Vref	Regulated Voltage Output Terminal	Regulated voltage output terminal at $V_{ref}=1.25V$ Having output current capacity of 15mA, this can be used for power supply for external circuit. Regulated at pin 16 (V_{CC}).
2	INPUT	FG Pulse Input Terminal	Input terminal for receiving FG pulse from motor.
3	BYPASS	Bypass Terminal	Reference (bypass) terminal of differential amplifier in waveform shaping circuit.
4	SPEED CONT	Tape Speed Selection Terminal	Input terminal for selecting tape speed, and can select either 1.2cm/sec or 2.4cm/sec.
5	C-UNIT	Current Limit Terminal	Terminal to connect output current limiting resistor for driver output. 7mA at 100 Ω (Std.).
6	OUTPUT	Driver Output Terminal	Driver output terminal to drive external motor driving transistor.
8	-VCC	Negativer Power Supply	Connect to make lowest voltage of IC.
9	STAND-BY	Stand-by Terminal	Switch terminal to electrically stand-by IC. Remove stand-by status by openning the terminal.
10	STARTER	Starter Terminal for Power Supply	Terminal to connect resistor for regulated power supply initial start. when it is not specially required to minimize the holding current during power off status, V_{EE} can be directly applied.
12	INITIALIZE	Initialize Terminal	Terminal to discharge the residual capacitance in the integrating capacitor at the time of power OFF.
13	FILTER	Integrating C and R Connection Terminal	Terminal to connect C and R in integrating circuit.
14	TIME CONST	Time Constant	Time constant for sawtooth wave is $C_T \cdot R_T$.
16	GND	Ground	Grounded to case or other with the maximum voltage of IC.

NOTES IN APPLICATIONS

1. In order to minimize the effect of noise generated from motor, this IC is grounded to the case at V_{CC} . Therefore, the external transistor is controlled with the voltage between pin 16 and 6.
2. The constant voltage at pin 1 is regulated with respect to pin 16 (GND: maximum voltage), but this is not regulated with respected to the minimum voltage of pin 8.

3. In waveform shaping circuit, there is no offset, and then, when the external bias resistors are the same as each other, the circuit will operate at zero cross operation.

The circuit will erroneously operate responding to the noise, and show the performance degradation.

Therefore, it is necessary to apply the pertinent offset by using R1 and R2 as shown in figure 1, in considering input voltage from FG.

Figure 1. Waveform shaping circuit

4. Pin 12 (initialize termina) will detect voltage reduction in IC, and discharge the externally connected capacitor at pin 13. Therefore, pin 12 is shorted to pin 13.

5. Sawtooth generating circuit, comparator circuit and integrating circuit are shown in figure 2.

Figure 2. Sawtooth generating circuit, comparison circuit and integrating circuit

5.1 Setting of R_T and C_T

Motor speed is determined by R_T and C_T . The following equation is approximately true for motor speed and $C_T \cdot R_T$.

$$f\left(\frac{NM}{60}\right) \approx \frac{1}{1.69C_T \cdot R_T}$$

$$\left(\approx \frac{1}{3.38C_T \cdot R_T} \quad \text{for double speed mode} \right)$$

where, N (rpm) for motor speed

M for poles at tachgenerator

R_T and C_T shall be set to satisfy the above equation, while keeping R_T between $10k\Omega$ and $500k\Omega$.

5.2 Setting of R_F , C_{F1} and C_{F2}

C_{F1} is the integrating capacitor, and R_F and C_{F2} are respectively resistor and capacitor for phase compensation. If the circuit becomes unstable when double speed is selected, add C for phase compensation using SW3.

Motor speed performance is determined with these circuit constants. Select these constants considering such factors as motor inertia, required start-up performance and wow flutter characteristics.

The following constants are standard:

$$R_F \approx 1 \sim 20k$$

$$C_{F1} \approx 0.01 \sim 5\mu F$$

$$C_{F2} \approx 0.1 \sim 50\mu F$$

6. Setting of R_{SC}

Output current limiting transistor is included in TD6303F, and output current is limited at the level where the voltage drop at R_{SC} becomes transistor base-emitter voltage V_{BE} (approximately $0.7V$ at $T_j=25^\circ C$).

The output shorting current I_{SC} at this time is;

$$I_{SC} = V_{BE} / R_{SC}$$

where, $V_{BE}(T_j=t^\circ C) = V_{BE}(T_j=25^\circ C) - 2mV(t=25^\circ)$

7. Setting of R_3

Stand-by current, while TD6303F is stand-by condition, is determined by stand-by switch (S1). The stand-by current is approximated as :

$$I_3 = \frac{V_{CC} - 0.6}{R_3 + 150k\Omega} \quad (\text{Resistor of } 150k\Omega \text{ is already in.})$$

TC5081AP

PHASE COMPARATOR

The TC5081AP consists of a digital phase comparator and an amplifier. Three state output connected to low pass filter (using an internal amplifier) will produce DC voltage to control a VCO.

Low state pulses appear on phase out as long as the loop is unlocked and these can be utilized as lock indicator.

Weight: 0.9g (Typ.)

TD62074P/AP/F/AF

○ 4 HIGH-VOLTAGE HIGH-CURRENT DARLINGTON TRANSISTOR ARRAYS

The TD62064P/AP/F/AF and TD62074P/AP/F/AF are high-voltage, high-current darlington drivers comprised of four NPN darlington pairs.

All units feature integral clamp diodes for switching inductive loads and all units of TD62074P/AP/F/AF feature uncommitted collectors and emitters for isolated darlington applications.

For proper operation, the substrate (SUB) must be connected to the most negative voltage.

Applications include relay, hammer, lamp and stepping moter drivers.

- Output current (Single Output) 1.5A MAX.
- High Sustaining Voltage Output 35V MIN. (TD62064P/F, 074P/F)
50V MIN. (TD62064AP/AF, 074AP/AF)
- Output Clamp Diodes : TD62064P/AP/F/AF
- Isolated Darlington Array : TD62074P/AP/F/AF
- Input Compatible with TTL and 5V C-MOS
- GND and SUB Terminal=Heat Sink
- Package Type-P, AP: DIP-16 pin
- Package Type-F, AF: PFP-16 pin

Weight DIP16-P-300A : 1.11g

TD62164AP/AF

○ 4 HIGH-VOLTAGE HIGH-CURRENT DARLINGTON TRANSISTOR ARRAYS

The TD62164AP/AF is high-voltage, high-current darlington drivers comprised of four NPN darlington pairs. All units feature integral clamp diodes for switching inductive loads.

Applications include relay, hammer, lamp and stepping moter drivers.

- Output Current (Single Output) 700mA MAX.
- High Sustaining Voltage Output 50V MIN.
- Output Clamp Diodes
- Input Compatible with TTL and 5V C-MOS
- GND and SUB Terminal Heat Sink
- Package Type-AP: DIP-16 pin
- Package Type-AF: PFP-16 pin

Weight DIP16-P-300A : 1.11g
SOP16-P-300 : 0.50g

(Note 2): C_L includes probe and jig capacitance.

TD62318BP

○ 4 LOW INPUT ACTIVE HIGH-CURRENT DARLINGTON TRANSISTOR ARRAYS

The TD62318BP is non-inverting transistor array which is comprised of four NPN darlington output stages and PNP input stages.

This device is low level input active driver and is suitable for operation with TTL, 5V C-MOS and 5V Microprocessor which have sink current output drivers.

Applications include relay, hammer, lamp and stepping motor drivers.

- Output Current (Single Output) 700mA MAX.
- High Sustaining Voltage Output 80V MIN.
- Output Clamp Diodes
- Input Compatible with TTL and 5V C-MOS
- Low Level Active Inputs
- Standard Supply Voltage
- Two Vcc Terminals Vcc1, Vcc2 (Separated)
- GND and SUB Terminal=Heat Sink
- Package Type-BP: DIP-16 pin

Weight : 1.11g

HANDLING PRECAUTIONS

5. HANDLING PRECAUTIONS

Designed and manufactured under Toshiba's high quality assurance system, semiconductor products offer satisfactory properties and quality for users. However, if such devices are selected inappropriately or are subjected to heavy thermal, mechanical, or electrical stress, their properties, quality, and reliability may be greatly affected.

The following are precautions to be taken to achieve up to 100% performance and to ensure satisfactory reliability of the devices mentioned herein.

If semiconductor elements are incorporated in units, there are particularly several aspects to which due consideration must be given concerning designing or assembly. These are also described below.

5-1 Common Items for Packages

(1) When a lead is bent or cut

The IC may be damaged mainly due to loss of adhesion resulting from relative stress applied between the main IC body and the lead. Take care to confine stress to the lead.

When bending a lead, bend it at a point more than 3 mm away from the IC body, not exceeding 90°C. Also, a suitable R (e. g., 0.5 Rmm) should be applied to permit safe usage without damage to surface treatment by the bending jig.

(2) When mounting an IC on a printboard, check the position of the IC.

If an IC is mounted in a wrong position, it may be broken when energized.

(3) When soldering using flux

Some constituents in flux may corrode package materials. To ensure the reliability of units, flux must be removed. For this purpose, a detergent or ultrasonic waves must be applied.

Generally, freon agents such as freon TF and Di-Freon solvent S3-E are recommended. If ultrasonic waves are used for cleaning, care must be taken to limit the output, while selecting 28 to 29 kHz, keep the devices and printboards away from the resonator, and limit processing time to 30 sec. so that no stress caused by resonance will be applied to the related devices and printboards.

(4) Mounting on printboards

When soldering the leads of an element onto a printboard, care must be taken not to leave stress applied to the leads. Reduce stress by shaping the leads to the holes, or by using a spacer between the device body and the printboard. Stress will persist if the leads, rather than being carefully shaped, are forced into the holes or pulled through with a tool (see Fig. 5-1). Parts subjected to stress may occasionally cause stress corrosion or whiskers, resulting in wire breakage or short-circuiting.

Thus, it is also necessary to adapt the hole size to the lead spacing.

Fig. 5-1

- (5) IC resistance to soldering heat is specified as 10 sec. at 260°C, and 3 sec. at 350°C when applied 1.5mm from the body. While soldering, lower temperature to a minimum by using jigs.
- (6) Thermal IC design

When heated above their maximum allowable junction temperature, IC's may deteriorate or destroy. Due consideration must be given to thermal designing. Pay attention to the following:

The absolute maximum rating of each IC represents its maximum junction temperature (T_j max.) or its operating temperature range (T_{opr}). On the basis of both values, obtain max. allowable junction temperature by using the $P_D - T_a$ characteristics.

Using a large radiator will not achieve sufficient radiation if the radiator is not tightened properly. This also should be considered at the design stage.

5-2 Special Notes on Packages

(1) Power consumption of power IC

Concerning integrated circuits, their circuit design, circuit constants, and supply voltages often are already determined, while power consumed under a specified supply voltage also can be determined.

Supply current and power consumption vary widely depending on individual elements. For small-signal IC's, thermal resistance of their peripheral units are designed so that even at the rated maximum, the maximum operating ambient temperature will not be exceeded.

However, for power integrated circuits that involve large variations in power consumption under external loading conditions, their maximum power consumption is specified by allowable power dissipation/ambient temperature characteristics as shown in Fig. 5-2. It is necessary to obtain power consumption under the worst conditions from this figure, and to design a heat radiator by calculating the max. ambient temperature.

Let's try designing a heat sink for TA7267BP.

[Example of heat sink designing: TA7267BP]

Refer to the thermal resistance data in Fig. 5-3.

Fig. 5-2

The saturated thermal resistance of this IC can be obtained from Fig. 5-2 (1)

$$\theta_{j-c} = \frac{150^{\circ}\text{C} - 75^{\circ}\text{C}}{12.5\text{W}} = 6^{\circ}\text{C/W} \text{ (thermal resistance from junction to case) } \dots\dots\dots (1)$$

Assuming that the IC is operated up to $V_{CC} = 18V$, $I_{OUT} = 1.0A$ and $T_a = 75^{\circ}C$, we have P_D (max.) = 3.1W. The thermal resistance θ_{HS} of the radiator to be mounted can be calculated by equation (3).

$$P_D \text{ (max.)} = V_{CC} \times I_{CC} + I_{OUT} \times (V_{CE(SAT)} \text{ upper} + V_{CE(SAT)} \text{ lower}) \dots\dots\dots (2)$$

$$\begin{aligned} \theta_{HS} &= \frac{T_{jmax} - T_a}{P_{D \text{ max}}} - R_{th(j-c)} \dots\dots\dots (3) \\ &= \frac{150^{\circ}C - 75^{\circ}C}{3.1W} - 6^{\circ}C/W \\ &= 18^{\circ}C/W \end{aligned}$$

This calls for use of a radiator having a thermal resistance of $18^{\circ}C/W$. The size (size, thickness, and material) can be determined by referring to Fig. 5-3 as about $15 \text{ cm}^2 \times 2\text{mm}$ aluminum from $18^{\circ}C/W$.

Note that when a radiator is joined to the IC, contact resistance is caused at the contact surface, resulting in lowered thermal conductivity. Thus, some allowances should be made in designing.

Fig. 5-3 Examples of radiator area versus thermal resistance

(2) Mounting of power devices on radiator

As for power devices, to allow power losses to thermally radiate efficiently through radiator, give due consideration to the following:

- Tightening torque

If devices are not completely tightened to the radiator, thermal resistance will increase, causing the device temperature to rise, which from the viewpoint of reliability, is unfavorable. On the other hand, with resin sealing packages, if the devices be excessively tightened, the pellets may be broken or the internal leads may be torn. To prevent such trouble, torque must be limited to levels recommended by manufacturers. As an example, Table 5-1 shows recommended torques for packages.

Table 5-1

Package	Recommended torque
TO-220	4 ~ 6 Kg·cm (0.4 ~ 0.6N·m)
Power IC	4 ~ 6 Kg·cm (0.4 ~ 0.6N·m)
Power IC with radiator fin	4 ~ 6 Kg·cm (0.4 ~ 0.6N·m)

- Flatness of radiator

When elements are mounted on radiators, adhesion should be investigated. Adhesion between the elements must be perfect with rigidity and no distortion. The maximum tolerance is 0.05mm. Should foreign matter such as cutting dust lodge between them, it will cause the pellets and resin parts to crack.

- Coherence

The most common procedure to achieve good cohesion between elements and radiator panels is to coat the contact surfaces with silicone grease. With plastic-sealed types, manufacturers' instructions must be followed as to the selection and quantity of grease used. With some greases, silicone will become separated from fat and oil, and if the resin and the fat and oil are in the some system, the fat and oil will permeate the resin, causing the chip protector films to swell, resulting in breakage of the bonding wire. Also an appropriate quantity must be used to prevent unwanted contact with the resin.

As an alternative to silicone grease, heat-conductive insulators (silicone rubber or etc.) are also effective with respect to cohesion and heat dissipation. They allow no permeation as previously mentioned above, but involve a problem to be noted in that they sometimes suffer from uneven tightening. (Uneven tightening is not a problem limited only to heat-conductive insulators, but also a problem with tightening in all cases.) If one side is tightened completely, the rubber sheet will be pushed out, and when the other side is tightened, the parts become as though foreign matter has been included, causing the pellet to crack.

(3) Mounting

If elements are soldered to leads and the printboard, and then mounted on radiators, take care to eliminate deviations between the radiators and mounting holes and the chassis. If such deviations exist, a large force will be applied, causing the internal leads to break or slacken, or the packages to break.

(4) Power flat package

The PFP enables P_D (power demand) to be enlarged compared with conventional DIP by certain effective mounting. The PFP is applicable in surface mounting, offers space convenience, and is most suitable for small motor drive circuits.

Shown below is an example of mounting.

Mounting on glass epoxy PCB

Fig. 5-4

As shown in Fig. 5-4, the PFP can be formed into a copper foil pattern on the PCB, and is usable as a radiator fin for the elements. The shape and dimensions of the copper foils are determined by thermal design of the elements. For mounting efficiency, refer to Fig. 5-5.

Fig. 5-5 $R\theta_{JA}$ mounting efficiency

5-3 Mounting of Flat Packages

For mounting Toshiba flat-type bipolar IC's, mounting methods conventionally used by our customers for mini-mold transistors and other small elements can be applied. Select the most appropriate one from among them.

(1) Method using soldering iron

Flat-type IC's should be secured with flux, adhesive or similar means. Use a soldering iron with a thin tip. Solder beads should be below 0.5mm in dia., and soldering conditions should be 10 sec. at 260°C or 3 sec. less at 350°C. The second soldering condition is more applicable to tests and repairs—not to volume soldering.

(2) Reflow soldering

Reflow soldering, the most common method for mounting chips (such as IC's, transistors, diodes, and resistors) on PCB's, is appropriate for volume soldering.

Those areas for parts to be mounted onto PCB's are coated with cream solder, and flat type IC's are mounted on them. The IC's are secured with the cream solder. Then the loaded PCB's are passed through a heating system (heat plate, tunnel kiln, or conveyor heater) to fuse the solder and join the IC's securely. An appropriate temperature range for this process is 210°C to 240°C. This method has the advantage of dislocations being corrected automatically when the solder is fused. Fig. 5-6 shows a recommended temperature profile for reflow soldering.

Precautions involved in reflow soldering are conducting sufficient preheating to remove thermal strain, and where infrared heaters are used, effect complete temperature control while duly considering the endothermic effect of black resin.

Fig. 5-6 Recommended temperature profile for reflow soldering

(3) Conductive pasting

Conductive pasting is a method that employs conductive paste instead of solder to mount parts. The paste is an epoxy mixed with gold or silver, which is coated on the contact areas. Parts are placed on them and cured at 100°C to 150°C for 1 to 3 hrs. This completes the process.

Compared with soldering methods, this method involves some difficulties in adhesion reliability. In this respect, adequate care must be taken.

(4) Mounting by dipping in solder

Mounting by dipping in solder cannot be recommended because it involves certain difficulties of thermal stress in pellets and a weakening of humidity resistance. However, it may be applicable for certain temperatures and for certain levels of reliability. Please consult Toshiba's Engineering or Quality Assurance Department.

6. PACKING INFORMATION

6. PACKING INFORMATION

To deliver flat IC packages, three package method are available: the same stick packages as the ordinary DIP type, taping, and embossed taping.

6-1 Stick Specifications for Flat Packages

- Shape and dimensions (Example: FLP type)

Fig. 6-1 Dimensions of Toshiba FLP bipolar IC stick

Material : Antistatic treated chloride vinyl

No. of IC's: 8-pin $\rightarrow$ 100 IC's/stick

14-/16-pin $\rightarrow$ 50 IC's/stick

* Both sides are fitted with synthetic-rubber stoppers.

6-2 Taping Specifications for Flat Packages

(1) Tape shape and dimensions (Fig. 6-2)

Fig. 6-2 Taping

(2) Winding reel shape and dimensions (Fig. 6-3)

Fig. 6-3 Reel for taping

(3) Direction of tape winding

Fig. 6-4 Direction of tape winding

(4) Standard quantity

The standard unit is 2,000 IC's per reel.

Kindly place orders in quantities equal to multiples of 2,000.

(An exception is 1,000-IC reels. For motor IC's, these include PFP16, PFP20, sealed IC's, for examples TA7736F, and TA7259F.)

(5) How to order

When ordering flat-type bipolar IC's on taping, specify the product name, taping direction, and quantity as follows:

(Example)

c) Types TE2412, 2416, 2420 (Fig. 6-7)

Fig. 6-7 Embossed taping types TE2412, 2416 and 2420

d) Types TE3212, 3216, 3220, 3224, 3228, 3232 (Fig. 6-8)

Fig. 6-8 Embossed taping types TE3212, 3216, 3220, 3224, 3228, and 3232

- For IC package shapes, the IC types listed above are selected, and the dimensions of A, B, C, D1, P1, T, and T2 are determined for packages. Please understand that, as for the standards for type selection and determination of dimensions, EIAJ [RC-1009B] is generally applied, with some exceptions involving handling.

(3) Seal tape dimensions

- Seal tape dimensions are appropriately determined for IC package shaped.

(4) Reel shape and dimensions (Fig. 6-9)

Fig. 6-9 Reel for embossed taping

- Length W varies with tape types as follows:

Tape shape	W	Reel
TE12□□ Type	12.4 $\begin{smallmatrix} +2.0 \\ -0 \end{smallmatrix}$	
TE16□□ Type	16.4 $\begin{smallmatrix} +2.0 \\ -0 \end{smallmatrix}$	R33
TE24□□ Type	24.4 $\begin{smallmatrix} +2.0 \\ -0 \end{smallmatrix}$	R53
TE32□□ Type	32.4 $\begin{smallmatrix} +2.0 \\ -0 \end{smallmatrix}$	R74

(5) Sealing direction (Fig. 6-10)

(Standard sealing direction)

Fig. 6-10 Winding direction for embossed taping

- Two sealing methods, types L and R, are applicable. The use of the standard direction type L (EL) can be recommended.

(6) How to order

- When ordering IC's on embossed taping, specify the product name, type of taping, sealing direction, and quantity as follows.

(Example) An order for 10,000 TA7745F IC's on embossed taping, sealing direction L:

* One reel contains 2,000 IC's. Please specify in multiples of 2,000.

(7) Transport and maintenance

- During transportation, take care to avoid subjecting the tape to heavy vibration.
- As for transportation and storage, keep the goods away from direct sunlight and at ambient temperatures below 45°C to prevent aging of seal tape separation resistance, and/or tape deformation.
